Steinmetz,2012-12-06 When conducting scientific research in any field it is not sufficient to simply design thoughtful and informative experiments to explore ideas and hypotheses The experiments must be conducted in such a manner that the data generated effectively address the ideas and hypotheses under study Collecting good data necessitates the use of good methods techniques and instrumentation Behavioral neuroscience is most certainly a field that over the years has required novel inventive and effective methods and tech niques to collect data on a rather difficult subject namely how the brain and nervous system encode behavior Perhaps one of the most interesting things about the field of behav ioral neuroscience is that most scientists in this field are engaged in a variety of activities it is not always the same boring routine The rule not the exception in this field is that investigators are trained in a variety of techniques and skills This work requires knowledge of skills in such diverse tech niques as surgery animal training basic electronics computer programming statistics and histology as well as having a good theoretical background knowledge of the relevant literature and the creativity and logic necessary to design and execute critical experiments One does not have to be an expert in all of these skills and conversely not all skills require an expert

**Classical Conditioning and Operant Conditioning** W.W. Henton,I.H. Iversen,2012-12-06 Since the appearance of the treatise on Schedules of Reinforcement by Ferster and Skinner over two decades ago the literature in behavior analysis both experimental and applied has been dominated by a range of studies dedicated to providing ever more systematic and refined accounts of these mainsprings of behavior control For the most part the analysis has been pursued in the best traditions of scientific methodology with careful attention to the isolation of controlling variables in unitary form Of late relatively simple interaction effects have provided an important additional focus for more sophisticated analyses It is clear however from even a cursory survey of the monumental research and conceptual analysis which is represented in this scholarly volume by Henton and Iversen that the surface of this complex behavioral interactions domain has barely been scratched The primary focus of this pioneering effort extends the competing response analysis across all experimental schedules both classical and instrumental as well as the interactions between the two Appropriately the analysis emphasizes overt behavioral interactions beginning with the simplest case of one operant and one respondent and inevitably implicating more diverse and subtle interactions As the analysis expands to include interactions between multiple recorded responses increasingly more precise empirical specifications of reciprocal interactions in response probabilities are revealed independently of conventional procedural labels i.e. operants respondents collaterals adjunctives etc and traditional theoretical distinctions
