Crobcoupling Reactions A Practical Guide:

Cross-Coupling Reactions Norio Miyaura, 2003-07-01 In 1972 a very powerful catalytic cycle for carbon carbon bond formation was first discovered by the coupling reaction of Grignard reagents at the sp carbon. Over the past 30 years the protocol has been substantially improved and expanded to other coupling reactions of Li, B, N, O, Al, Si, P, S, Cu, Mn, Zn, In, Sn and Hg compounds. These reactions provided an indispensable and simple methodology for preparative organic chemists. Due to the simplicity and reliability in the carbon carbon carbon heteroatom and carbon metalloid bond formations as well as high efficiency of the catalytic process the reactions have been widely employed by organic chemists in various fields. Application of the protocol ranges from various syntheses of complex natural products to the preparation of biologically relevant molecules including drugs and of super molecules and to functional materials. The reactions on solid surfaces allow robot synthesis and combinatorial synthesis. Now many organic chemists do not hesitate to use transition metal complexes for the transformation of organic molecules. Indeed innumerable organic syntheses have been realized by the catalyzed reactions of transition metal complexes that are not achievable by traditional synthetic methods. Among these the metal catalyzed cross coupling reactions have undoubtedly contributed greatly to the development of such a new area of metal catalyzed organic syntheses. An excellent monograph for the cross coupling reactions and other metal catalyzed C C bond forming reactions recently appeared in *Metal catalyzed Cross coupling Reactions* Wiley VCH 1998.
