The Rating of DOT Worker Functions and Worker Traits

PAMELA S. CAIN *and* BERT F. GREEN, JR.

In the course of producing the DOT, jobs and occupations were rated for a variety of characteristics, called worker functions and worker traits. These ratings and the procedures by which they were assigned are described in chapter 6. Because of the widespread and varied use made of these ratings both inside and outside the U.S. Employment Service, it is especially important that they be accurate—that is, that they measure what they purport to measure.

The ratings assigned to DOT occupations, like all such ratings, are subject to various influences, some of which are legitimate bases of variation and some of which are not. An occupation might be rated differently on a given characteristic not only because it actually requires different levels or amounts of the characteristic in question but also because of the particular circumstances in which the ratings were made, characteristics of the raters, specific features of the occupation itself, etc. Such ratings invariably entail some measurement error; they reflect, to some extent, characteristics other than those they are supposed to measure.

There are several reasons to suspect that the ratings of DOT occupations for worker functions and worker traits are subject to error. First, the factors that the DOT scales purport to measure are vague and ambiguously defined. It is not readily apparent what they are intended to measure, i.e., what the "true" scores of the phenomenon being rated should be. Worker functions, for example, are said to "express the total level of complexity of the job-worker situation" (U.S. Department of Labor, 1972:5), but
