Stormwater Runoff, 1983 **Countermeasures for Pollution from Overflows** Richard Field, John A. Lager, 1974 Control and or treatment of stormwater discharges and combined sewage overflows from urban areas are problems of increasing importance in the field of water quality management Over the past decade much research effort has been expended and a large amount of data has been generated primarily through the actions and support of the U S Environmental Protection Agency's EPA Storm and Combined Sewer Research and Development Program Presented in this text are selected results of a comprehensive investigation and assessment of promising completed and ongoing projects representative of the state of the art in abatement theory and technology a look at recent legislation and the identification of program needs and emphasis Combined sewer overflows are major sources of water pollution problems but even discharges of stormwater alone can seriously affect water quality Current approaches involve control of overflows treatment and combinations of the two Control may involve maximizing treatment with existing facilities control of infiltration and extraneous inflows surface sanitation and management as well as flow regulation and storage A number of treatment methods have been evaluated including high rate screening and microstraining ultra high rate filtration dissolved air flotation physical chemical treatment and modified biological processes A swirl flow regulator solids separator of annular shape construction with no moving parts has been developed High rate disinfection methods including new disinfectants have been applied Promising approaches involve integrated use of controls and treatment The most disappointing have generally lacked flexibility in their operation and design Mathematical models have been developed and successfully applied at multiple levels of sophistication and complexity

Efforts aimed at reducing combined sewer overflow CSO pollutant loads on the Muddy Creek receiving waters in Cincinnati OH have been undertaken in recent years This includes an investigation of the treatment performance of a flow through wet weather treatment facility WWTF using off line sedimentation tanks fine screens and chemical disinfection which was inactive during this study Calculations using hydrographs and water quality samples collected at the WWTF during rain events established the mass of BOD5 COD and TSS removed Most pollutant removal was achieved through settling and storage in the treatment tanks with removal efficiencies of 20 50% for BOD5 and 25 70% for TSS commonly observed Owing

to the high pollutant concentration in the early stages of the rain event first flush containment or capturing and conveying the early portion of the runoff event to the WWTP was the most efficient treatment method for every storm Nevertheless unacceptable levels of total coliform and E coli were measured entering the creek stressing the need for disinfection
