▲ The continent on the left has a passive continental margin, while the continent on the right has an active subduction margin.

▲ As the continents move closer, the ocean between the converging continents is eliminated. The oceanic crust is telescoped, creating a succession of overlapping thrust faults, which ride up, one over the other.

▲ As the slices become more and more tightly squeezed, they are forced upward. The upper part of each thrust sheet turns horizontal, forming a nappe, which then glides forward under gravity. A mass of metamorphic rock forms between the joined continental plates, welding them together. This new rock mass is the continental suture.

**Continents in Collision** Russell Miller, Time-Life Books, 1983 Presents evidence supporting Alfred Wegener's theory of continental drift Explains plate tectonics and discusses what is known of the earth's crust and upper mantle Continents in Collision Keith J. Miller, 1982      **Continents in Collision** Keith J. Miller, 1982      **Continents in Collision; Planet Earth** Russell Miller, 1983      **Earth System History** Steven M. Stanley, 2004-10-29 Designed for a new generation of readers Stanley's Earth System History is a reforging of his Exploring Earth and Life Through Time Adopting an earth system approach throughout Earth System History shows students how Earth's ecosystem has developed over time and how events in the past provide a perspective for dealing with present and future changes Clear and concise the new Second Edition of this introduction to historical geology is perfect for one term non majors courses and contains lots of new content and improved visuals      **Continents in Collision** Robert A. Hecht, 1982      *Arc-Continent Collision* Dennis Brown, Paul D. Ryan, 2011-06-29 Arc continent collision has been one of the important tectonic processes in the formation of mountain belts throughout geological time and it continues to be so today along tectonically active plate boundaries such as those in the SW Pacific or the Caribbean Arc continent collision is thought to have been one of the most important process involved in the growth of the continental crust over geological time and may also play an important role in its recycling back into the mantle via subduction Understanding the geological processes that take place during arc continent collision is therefore of importance for our understanding of how collisional orogens evolve and how the continental crust grows or is destroyed Furthermore zones of arc continent collision are producers of much of the world's primary economic wealth in the form of minerals so understanding the processes that take place during these tectonic events is of importance in modeling how this mineral wealth is formed and preserved This book brings together seventeen papers that are dedicated to the investigation of the tectonic processes that take place during arc continent collision It is divided into four sections that deal firstly with the main players involved in any arc continent collision the continental margin the subduction zone and finally the volcanic arc and its mineral deposits The second section presents eight examples of arc continent collisions that range from being currently active through to Palaeoproterozoic in age The third section contains two papers one that deals with the obduction of large slab ophiolites and a second that presents a wide range of physical models of arc continent collision The fourth section brings everything that comes before together into a discussion of the processes of arc continent collision      *The Evolving Continents* Timothy M. Kusky, Mingguo Zhai, Wenjiao Xiao, 2010 This volume honours the career of Brian F Windley who has been hugely influential in helping to achieve our current understanding of the evolution of the continental crust and who has inspired many students and scientists to pursue studies on the evolution of the continents Brian has studied processes of continental formation and evolution on most continents and of all ages and has educated and inspired two generations of geologists to undertake careers in studies of continental evolution The volume is organized into six sections

including oceanic and island arc systems and continental growth tectonics of accretionary orogens and continental growth growth and stabilization of continental crust collisions and intraplate processes Precambrian tectonics and the birth of continents and active tectonics and geomorphology of continental collision and growth zones     Subduction and Collision Dynamics of Tectonic Plates Zhong-Hai Li, Jie Liao, Lijun Liu, Manuele Faccenda, 2022-11-07     **Intra-oceanic Subduction Systems** Robert D. Larter, Philip T. Leat, 2003 Recycling of oceanic plate back into the Earth's interior at subduction zones is one of the key processes in Earth evolution Volcanic arcs which form above subduction zones are the most visible manifestations of plate tectonics the convection mechanism by which the Earth loses excess heat They are probably also the main location where new continental crust is formed the so called subduction factory About 400f modern subduction zones on Earth are intra oceanic These subduction systems are generally simpler than those at continental margins as they commonly have a shorter history of subduction and their magmas are not contaminated by ancient sialic crust They are therefore the optimum locations for studies of mantle processes and magmatic addition to the crust in subduction zones
