Content Distribution Networks Dinesh C. Verma, 2003-04-08 Content distribution networks CDNs are the most promising new techniques for coping with the huge and swiftly growing volume of Internet traffic In essence CDNs are groups of proxy servers located at strategic points around the Internet and arranged so as to ensure that a download request can always be handled from the nearest server In this the first reference in the field a recognized CDN pioneer describes the various technologies involved and explains how they came together to form a working system With the help of case studies he covers all the practical basics and provides invaluable implementation schemes

Introduction to Content Delivery Networks (CDN) Shehan Marasinghe, 2020-07 Lightning fast web loading is one of the major promises that almost every modern web hosting company mentions in their advertisements Achieving this goal involves a lot of methodologies because the web load time depends on many factors such as the size of web page content blocks the performance level of the server the distance between server and visitor Content Delivery Networking CDN is a methodology to increase the web load speed by reducing the distance between the server and the visitor A CDN can be defined as a group of servers that are located in different geographical locations to facilitate the distribution of content via the web in an efficient and timely manner The main goal of a CDN is to serve content from the closest server to the visitor instead of getting served from the origin web server

**Streaming Content Distribution Networks with Minimum Delivery Cost** Jussara M. Almeida, 2003

**Content-aware Caching and Traffic Management in Content Distribution Networks** Meghana Mukund Amble, 2012 The rapid increase of content delivery over the Internet has lead to the proliferation of content distribution networks CDNs Management of CDNs requires algorithms for request routing content placement and eviction in such a way that user delays are small Our objective in this work is to design feasible algorithms that solve this trio of problems We abstract the system of front end source nodes and back end caches of the CDN in the likeness of the input and output nodes of a switch In this model queues of requests for different pieces of content build up at the source nodes which route these requests to a cache that contains the content For each request that is routed to a cache a corresponding data file is transmitted back to the source across links of finite capacity Caches are of finite size and the content of the caches can be refreshed periodically A requested but missing item is fetched to the cache from the media vault of the CDN In case of a lack of adequate space at the cache an existing unrequested item may be evicted from the cache in order to accommodate a new item Every such cache refresh or media vault access incurs a finite cost Hence the refresh periodicity allowed to the system represents our system cost In order to obtain small user delays our algorithms must consider the lengths of the request queues that build up at the nodes Stable policies ensure the finiteness of the request queues while good policies also lead to short queue lengths We first design a

throughput optimal algorithm that solves the routing placement eviction problem using instantaneous system state information The design yields insight into the impact of different cache refresh and eviction policies on queue length We use this and construct throughput optimal algorithms that engender short queue lengths We then propose a regime of algorithms which remedies the inherent problem of wastage of capacity We also develop heuristic variants and we study their performance We illustrate the potential of our approach and validate all our claims and results through simulations on different CDN topologies

Content Distribution Network's Technology Mustafa Khan,Muhammad Irfan Younas Mughal,2010-06 In this challenging economical era of Internet and Globalization the need for more and more data distribution to different users on various types of networks in short time and at a nominal cost has also been amplified drastically The widespread growth of the World Wide Web has made information easy to disseminate and distribute over a network of computer networks i e Internet Content Distribution Network CDN is a system of computers holding copies of data placed at different nodes in a network in order to maximize bandwidth for access to the data from clients throughout the network A client accesses a copy of the data near to the client as opposed to all clients accessing the same central server so as to avoid bottleneck near that server Content Distribution Networks encompass so many benefits such as dynamic routing and efficient distribution of content to reduce user delay CDN provides users their requested content from the fastest point of presence no matter where in the world they are located

**Efficient In-network Content Distribution** Michele Mangili,2015 In recent years the amount of traffic requests that Internet users generate on a daily basis has increased exponentially mostly due to the worldwide success of video streaming services such as Netflix and YouTube While Content Delivery Networks CDNs are the de facto standard used nowadays to serve the ever increasing users demands the scientific community has formulated proposals known under the name of Content Centric Networks CCN to change the network protocol stack in order to turn the network into a content distribution infrastructure In this context this Ph D thesis studies efficient techniques to foster content distribution taking into account three complementary problems

- 1 We consider the scenario of a wireless heterogeneous network and we formulate a novel mechanism to motivate wireless access point owners to lease their unexploited bandwidth and cache storage in exchange for an economic incentive
- 2 We study the centralized network planning problem and I we analyze the migration to CCN II we compare the performance bounds for a CDN with those of a CCN and III we take into account a virtualized CDN and study the stochastic planning problem for one such architecture
- 3 We investigate the security properties on access control and trackability and formulate ConfTrack CCN a CCN extension to enforce confidentiality trackability and access policy evolution in the presence of distributed caches
