which was reported in one of the recent annual meetings of the European Mathematical Psychology Group The Group finds it worthwhile to disseminate this work using a review process which is somewhat less strict and a publication lag which is shorter than would be the case for standard international journals The editor is happy that the meetings of the European Mathematical Psychology Group are regularly attended by colleagues from overseas Their contributions also appear in this volume as was the case in earlier volumes Despite apparent heterogeneity the reader will observe that European mathematical psychologists have a keen interest in basic issues of mathematical modeling and measurement theory and that also substantive topics such as decision making perception and performance are studied in the context of formal modeling Also and perhaps of more than casual importance for future developments is the fact that theory experiment and data analysis go closely together It should therefore not surprise that psychometric topics and topics in scaling are represented in this volume alongside with topics of a more purely mathematical nature

Knowledge Structures Dietrich Albert, 2013-06-29 This book is a sign of its times Each one of the chapters papers written by European authors of various backgrounds illustrates a departure from the style of theorizing that has been prominent in the behavioral and social sciences for most of the century Until very recently models for behavioral phenomena were chiefly based on numerical representations of the objects of concern e.g. the subjects and the stimuli under study This was due in large part to the influence of nineteenth century physics which played the role of the successful older sister the one that had to be imitated if one wished to be taken seriously in scientific circles The mystical belief that there could be science only when the objects of concern were susceptible of measurement in the sense of physics was a credo that could not be violated without risks Another more honorable justification was that the numerical models were the only ones capable of feasible calculations In fact these models were typically linear An early example of such theorizing in psychology is factor analysis which attempted to represent the results of mental tests in a real vector space of small dimensionality each subject being represented by a point in that space A dimension was interpreted as a scale measuring some mental ability The analysis was simple and only required an electrical desk calculator with spinning wheels and a suitable amount of determination
