Control Identification And Input Optimization:

Control, Identification, and Input Optimization Robert Kalaba, Karl Spingarn, 2012-12-12 This book is a self contained text devoted to the numerical determination of optimal inputs for system identification It presents the current state of optimal inputs with extensive background material on optimization and system identification The field of optimal inputs has been an area of considerable research recently with important advances by R Mehra G c Goodwin M Aoki and N E Nahi to name just a few eminent investigators The authors interest in optimal inputs first developed when F E Yates an eminent physiologist expressed the need for optimal or preferred inputs to estimate physiological parameters The text assumes no previous knowledge of optimal control theory numerical methods for solving two point boundary value problems or system identification As such it should be of interest to students as well as researchers in control engineering computer science biomedical engineering operations research and economics In addition the sections on beam theory should be of special interest to mechanical and civil engineers and the sections on eigenvalues should be of interest to numerical analysts The authors have tried to present a balanced viewpoint however primary emphasis is on those methods in which they have had first hand experience Their work has been influenced by many authors Special acknowledgment should go to those listed above as well as R Bellman A Miele G A Bekey and A P Sage The book can be used for a two semester course in control theory system identification and optimal inputs

Bitmead,Michael A. Johnson,Michael J. Grimble,2000 Adaptive Systems have been studied for a substantial period as the logical intersection between modelling and design in control and signal processing Because of this adaptive systems studies need to live in these two worlds while introducing concepts of their own These reflect the requirements to track significant system variations or to eliminate initial parameter uncertainty all the while maintaining satisfactory transient performance Historically Adaptive Systems and notably Adaptive Control have been the subject of takeover bids by neighbouring tribes from fields such as gain scheduling identification robust design or nonlinear systems The response to this has been to add impetus to the understanding of the connections between these disciplines and adaptation leading in turn to improvements of theory and practice We would appear to be currently in a period where there are increasing contacts being made with fields such as Learning Systems Computer Architectures and Identification Rather than hostile takeovers these have helped to expand the capability of Adaptive systems dramatically In this IFAC Workshop on Adaptive control and Signal Processing a wide range of papers
