Kane, 2022-09-01 William Lewis Manly was a forty niner explorer and humanitarian whose story most people have never heard Born in Vermont William Lewis Manly was drawn out west by the lure of gold Previous scholarship claims that the Yankee frontiersman floated only 290 miles down the Green River to the Uinta Basin but author Michael D Kane's research of primary source materials led him to the conclusion that Manly actually traveled 415 miles all the way to what is now Green River Utah This would make Manly the first to explore much of the Green River by boat twenty years before John Wesley Powell's famous expedition Determined to prove his theory and establish Manly's legacy as a trailblazer Kane conducted research and then built his own wooden canoes and made the trip tracing Manly's footsteps and comparing notes with the earlier traveler Country Never Trod follows Manly's little known expedition down the Green River and his overland trek through some of the most desolate stretches of Utah interspersed with Kane's journal entries and photographs documenting his own trip *Labyrinth Canyon River Guide* Thomas G. Webb, S. A. Leake, Raymond M. Turner, 2007 Woody wetlands constitute a relatively small but extremely important part of the landscape in the southwestern United States These riparian habitats support more than one third of the region's vascular plant species are home to a variety of wildlife and provide essential havens for dozens of migratory animals Because of their limited size and disproportionately high biological value the goal of protecting wetland environments frequently takes priority over nearly all other habitat types In The Ribbon of Green hydrologists Robert H Webb and Stanley A Leake and botanist Raymond M Turner examine the factors that affect the stability of woody riparian vegetation one of the largest components of riparian areas Such factors include the diversion of surface water flood control and the excessive use of groundwater Combining repeat photography with historical context and information on species composition they document more than 140 years of change Contrary to the common assumption of widespread losses of this type of ecosystem the authors show that vegetation has increased on many river reaches as a result of flood control favorable climatic conditions and large winter floods that encourage ecosystem disturbance germination and the establishment of species in newly generated openings Bringing well documented and accessible insights to the ecological study of wetlands this book will influence our perception of change in riparian ecosystems and how riparian restoration is practiced in the Southwest and it will serve as an important reference in courses on plant ecology riparian ecology and ecosystem management Canyon Hiking Guide to the Colorado Plateau Michael R.
