

Defining "Chronic Obstructive Pulmonary Disease (COPD)"

COPD

Systemic disease, largely manifesting as an airflow-obstructing respiratory disorder; can manifest in the form of any of the following disorders:

Emphysema

Lung tissue destruction & abnormal, permanent enlargement of lung acini: airspaces distal to terminal bronchioles

Chronic Bronchitis

Chronic, productive cough for a total duration of 3 months per year, over 2 continuous years

Asthma

Asthma that does not remit completely with treatment (thus, chronic airflow obstruction) is defined as asthma-COPD overlap syndrome (ACOS)

Bronchiectasis

Destruction and widening of large airways, resulting in mucus hyper-secretion and recurrent infections

Cystic Fibrosis

Multisystem disease due to CFTR gene mutation, that presents in the lungs as bronchiectasis

Most common COPD manifestations
(most patients suffer from a combination of emphysema and chronic bronchitis)

Clinically, COPD is seen as:

- Progressive, partially reversible airflow obstruction and lung hyperinflation (causing respiratory symptoms like cough, sputum production, and dyspnea)
- Post-bronchodilator spirometry results: FEV1/FVC ratio < 0.7 (FEV1 is not a defining feature of COPD, but a marker of severity)
- ↑ frequency & severity of acute exacerbations
- Systemic manifestations such as deconditioning and muscle weakness
