Clinical Exercises In Internal Medicine Vol 1 Thyroid Disease:

Diagnosis and Management of Endocrine-related Tumors Richard J. Santen, Andrea Manni, 2012-12-06 Patients with a variety of tumors present to the physician because of clinical manifestations of hormones secreted in excess This phenomenon attracted the investigative interest of such pioneers as Harvey Cushing who recognized that pituitary tumors may cause acromegaly and Charles Mayo who associated hyper tension with adrenal medullary neoplasms Current interest in endocrine related tumors has intensified because of the explosive development of newer methodology for their study Specific measurements of secretory products hybridization assays to identify products of genomic translation and quantitative assessment of tissue hormone receptors have provided means of characterizing and precisely following patients with endocrine related tumors Treatments based upon these advances are rapidly proliferating The current volume attempts to synthesize much of this recent information with the goal of providing a sound basis for making clinical judgements regarding diagnosis and management Tumors of endocrine glandular tissues commonly confront practicing physicians with difficult management problems Several unique features of these tumors necessitate collaboration among various specialty disciplines in order to resolve these problems and to provide a high level of clinical care For example endocrine neoplasms secrete active hormones or hormone precursors which produce clinical manifestations most familiar to endocrinologists Certain therapies such as radioactive iodine for thyroid cancer take advantage of the hormone responsiveness of these tumors to facilitate treatment These aspects require individuals trained in endocrinology to implement complex diagnostic and therapeutic maneuvers

Graves' Disease Basil Rapoport, Sandra M. McLachlan, 2012-12-06 From the perspective of the investigator Graves disease is a fascinating disorder with unique features and opportunities for study The discovery in 1956 that Graves disease was caused by a humoral factor later shown to be an antibody to the TSH receptor was a triumph for modern investigative medicine Rapid progress is now being made in i understanding the molecular interaction between autoantibodies and the TSH receptor ii identifying the genes that contribute to the predisposition to disease iii developing an animal model of Graves disease and iv identifying the long sought orbital antigen in ophthalmopathy From the clinical standpoint although Graves disease is eminently treatable there is no definitive cure None of the therapeutic options are ideal It is hoped that rapid progress in understanding the pathogenesis of the disease will lead to the ultimate goal of some form of immunotherapy that will make antithyroid drugs radioiodine and thyroidectomy obsolete The chapters in Graves Disease Pathogenesis and Treatment represent the viewpoints of many prominent clinicians and investigators working in the field The editors are grateful for their contributions which cover an unusually comprehensive compendium of subjects relating to the disease
