Current Controversies in Neurosurgery Thomas P. Morley, 1976 Subject Guide to Books in Print, 1996 Invisible Wounds of War Terri L. Tanielian, Lisa Jaycox, 2008

Since October 2001 approximately 1 64 million U S troops have been deployed for Operations Enduring Freedom and Iraqi Freedom OEF OIF in Afghanistan and Iraq Early evidence suggests that the psychological toll of these deployments many involving prolonged exposure to combat related stress over multiple rotations may be disproportionately high compared with the physical injuries of combat In the face of mounting public concern over post deployment health care issues confronting OEF OIF veterans several task forces independent review groups and a Presidential Commission have been convened to examine the care of the war wounded and make recommendations Concerns have been most recently centered on two combat related injuries in particular post traumatic stress disorder and traumatic brain injury With the increasing incidence of suicide and suicide attempts among returning veterans concern about depression is also on the rise The study discussed in this monograph focuses on post

traumatic stress disorder major depression and traumatic brain injury not only because of current high level policy interest but also because unlike the physical wounds of war these conditions are often invisible to the eye remaining invisible to other servicemembers family members and society in general All three conditions affect mood thoughts and behavior yet these wounds often go unrecognized and unacknowledged The effect of traumatic brain injury is still poorly understood leaving a large gap in knowledge related to how extensive the problem is or how to address it RAND conducted a comprehensive study of the post deployment health related needs associated with these three conditions among OEF OIF veterans the health care system in place to meet those needs gaps in the care system and the costs associated with these conditions and with providing quality health care to all those in need This monograph presents the results of our study which should be of interest to mental health treatment providers health policymakers particularly those charged with caring for our nation s veterans and U S service men and women their families and the concerned public All the research products from this study are available at <http://veterans.rand.org> Data collection for this study began in April 2007 and concluded in January 2008 Specific activities included a critical review of the extant literature on the prevalence of post traumatic stress disorder major depression and traumatic brain injury and their short and long term consequences a population based survey of service members and veterans who served in Afghanistan or Iraq to assess health status and symptoms as well as utilization of and barriers to care a review of existing programs to treat service members and veterans with the three conditions focus groups with military service members and their spouses and the development of a microsimulation model to forecast the economic costs of these conditions overtime Among our recommendations is that effective treatments documented in the scientific literature evidence based care are available for PTSD and major depression Delivery of such care to all veterans with PTSD or major depression would pay for itself within two years or even save money by improving productivity and reducing medical and mortality costs Such care may also be a cost effective way to retain a ready and healthy military force for the future However to ensure that this care is delivered requires system level changes across the Department of Defense the Department of Veterans Affairs and the U S health care system
