Control Processes in Multicellular Organisms G. E. W. Wolstenholme, Julie Knight, 2009-09-16 The Novartis Foundation Series is a popular collection of the proceedings from Novartis Foundation Symposia in which groups of leading scientists from a range of topics across biology chemistry and medicine assembled to present papers and discuss results The Novartis Foundation originally known as the Ciba Foundation is well known to scientists and clinicians around the world

Latchman, Venugopalan Cheriya, 2025-02-26 The new edition of Gene Control for the first time provides extensive coverage on prokaryotic gene regulation which makes it the only textbook offering a complete and detailed account of gene control for both prokaryotic and eukaryotic organisms The core objective of this edition is to educate students about the fundamental principles and mechanisms governing gene expression regulation and function To reinforce these ideas each chapter now includes discussion questions to promote critical thinking There are also multiple choice questions and animations for students and a large question bank and figure slides for instructors The textbook also emphasizes the vital role of scientific experiments and evidence in shaping our current understanding of gene control and provides comprehensive coverage of essential gene expression techniques and methodologies throughout the book This extensively updated edition of the renowned textbook Gene Control will remain a valuable resource for students instructors researchers and medical professionals exploring various aspects of gene control ranging from the regulation of genes in infectious diseases to embryonic development across different organisms from bacteria to humans      **National Library of Medicine Current Catalog** National Library of Medicine (U.S.), 1965

Welch, 1968      **Current Topics in Cellular Regulation** Bernard L. Horecker, Earl R.

Stadtman, 2014-06-28 Current Topics in Cellular Regulation Volume 4 presents the fundamental mechanisms involved in the regulation of diverse cellular activities including cellular differentiation intermediary metabolism and the transfer of genetic information This book provides information pertinent to the various aspects of cellular regulation Organized into six chapters

this volume begins with an overview of the activity of ornithine transcarbamylase that catalyzes the condensation of carbamyl phosphate with ornithine This text then presents and discusses the in vitro data that are available on the molecular interactions that govern the expression of lactose lac operon Other chapters consider the bovine liver which has been characterized in terms of molecular and kinetic characteristics This book discusses as well the de novo synthesis of saturated fatty acids which is catalyzed by two enzyme systems The final chapter deals with the factors leading to glycogenolysis as it occurs in mammalian skeletal muscle This book is a valuable resource for biologists and biochemists

**Dynamic regulation of DNA methylation in human T-cell biology** Antonio Lentini, 2019-03-19 T helper cells play a central role in orchestrating immune responses in humans Upon encountering a foreign antigen T helper cells are activated followed by a differentiation process where the cells are specialised to help combating the infection Dysregulation of T helper cell activation differentiation and function has been implicated in numerous diseases including autoimmunity and cancer Whereas gene regulatory networks help drive T cell differentiation acquisition of stable cell states require heritable epigenetic signals such as DNA methylation Indeed the establishment of DNA methylation patterns is a key part of appropriate T cell differentiation but how this is regulated over time remains unknown Methylation can be directly attached to cytosine residues in DNA to form 5 methylcytosine 5mC but the removal of DNA methylation requires multiple enzymatic reactions commonly initiated by the conversion into 5 hydroxymethylcytosine 5hmC thus creating a highly complex regulatory system This thesis aimed to investigate how DNA methylation is dynamically regulated during T cell differentiation To this end we employed large scale profiling techniques combining gene expression as well as genome wide 5mC and 5hmC measurements to construct a time series model of epigenetic regulation of differentiation This revealed that early T cell activation was accompanied by extensive genome wide deposition of 5hmC which resulted in demethylation upon proliferation Early DNA methylation remodelling through 5hmC was not only indicative of demethylation events during T cell differentiation but also marked changes persisting longterm in memory T cell subsets These results suggest that priming of epigenetic landscapes in T cells is initiated during early activation events preceding any establishment of a stable lineage which are then maintained throughout the cells lifespan The regions undergoing remodelling were also highly enriched for genetic variants in autoimmune diseases which we show to be functional through disruption of protein binding These variants could potentially disrupt gene regulatory networks and the establishment of epigenetic priming highlighting the complex interplay between genetic and epigenetic layers In the course of this work we discovered that a commonly used technique to study genome wide DNA modifications DNA immunoprecipitation DIP seq had a false discovery rate between 50 99% depending on the modification and cell type being assayed This represented inherent technical errors related to the use of antibodies resulting in off target binding of repetitive sequences lacking any DNA modifications These sequences are common in mammalian genomes making robust detection of rare DNA modifications very difficult due to the high

background signals However offtarget binding could easily be controlled for using a non specific antibody control which greatly improved data quality and biological insight of the data Although future studies are advised to use alternative methods where available error correction is an acceptable alternative which will help fuel new discoveries through the removal of extensive background signals Taken together this thesis shows how integrative use of high resolution epigenomic data can be used to study complex biological systems over time as well as how these techniques can be systematically characterised to identify and correct errors resulting in improved detection
