An Exploratory Analysis of Convoy Protection Using Agent-Based Simulation Matthew B. Hakola, 2004-06-01 Recent insurgent tactics during Operation Iraqi Freedom OIF have demonstrated that coalition logistical convoys are vulnerable targets This thesis examines the tactics techniques and procedures TTPs used in convoy operations in an attempt to identify the critical factors that lead to mission success A ground convoy operation scenario is created in the agent based model ABM Map Aware Non uniform Automata MANA The scenario models a generic logistical convoy consisting of security vehicles logistical vehicles an unmanned aerial vehicle UAV and an enemy ambushing force The convoy travels along a main supply route MSR where it is ambushed by a small insurgent force

We use military experience judgment and exploratory simulation runs to identify 11 critical factors within the created scenario The data farming process and Latin Hypercube LHC experimental design technique are used to thoroughly examine the 11 factors Using the 11 factors 516 design points are created and data farmed over to produce 25 800 observations Additive multiple linear regression is used to fit a model to the 25 800 observations From the created scenario it is concluded that convoy mission success may be determined by only a few factors the actions of logistical vehicles are more critical than those of security vehicles UAVs provide a statistically significant advantage and ABMs coupled with LHCs and data farming are valuable tools for understanding complex problems
