**Computer-Based Automation** Julius T. Tou, 2012-12-06 It has been recognized that productivity improvement is an

important issue of the 80 s It is regarded as the most efficient way to improve national economy and to enrich the quality of life The key to productivity improvement is advanced automation especially computer integrated automation for engineering design and office operations as well as manufacturing processes This is the theme of 1983 International Conference on Advanced Automation ICAA 83 This book contains the articles which are the revised and updated version of the papers presented at the ICAA 83 Conference Traditionally automation is synonymous with mechanization but this Conference has treated automation from a different point of view We consider automation as a process to unify various automated information processing systems for performing business administration design engineering and manufacturing functions in addition to the traditional fixed automation in production In other words design automation and office automation form an integral part of factory automation to accomplish comprehensive computer integrated manufacturing and production In engineering and manufacturing today quality design and high productivity are synonymous with the use of computers robots expert systems and other computer based technologies The greater the degree of computer based automation exploited and implemented the greater a nation s ability to survive in tomorrow s extremely competitive world market **Integrated**

**Networking, Caching, and Computing** F. Richard Yu, Tao Huang, Yunjie Liu, 2018-06-13 This book features the major research advances on integrated networking caching and computing Information centric networking based caching is one of the promising techniques for future networks The cloud computing paradigm has been widely adopted to enable convenient on demand network access to a shared pool of configurable computing resources In addition fog edge computing is proposed to deploy computing resources closer to end devices From the perspective of applications network cache and compute are underlying enabling resources How to manage control and optimize these resources can have significant impacts on application performance Cyberspace Mimic Defense Jiangxing Wu, 2019-12-02 This book discusses uncertain threats

which are caused by unknown attacks based on unknown vulnerabilities or backdoors in the information system or control devices and software hardware Generalized robustness control architecture and the mimic defense mechanisms are presented in this book which could change the easy to attack and difficult to defend game in cyberspace The endogenous uncertain effects from the targets of the software hardware based on this architecture can produce magic mimic defense fog and suppress in a normalized mode random disturbances caused by physical or logic elements as well as effects of non probability disturbances brought by uncertain security threats Although progress has been made in the current security defense theories in cyberspace and various types of security technologies have come into being the effectiveness of such theories and technologies often depends on the scale of the prior knowledge of the attackers on the part of the defender and on the acquired real timing and accuracy regarding the attackers behavior features and other information Hence there lacks an efficient active defense means to deal with uncertain security threats from the unknown Even if the bottom line defense technologies such as encrypted verification are adopted the security of hardware software products cannot be quantitatively

designed verified or measured Due to the loose coupling relationship and border defense modes between the defender and the protected target there exist insurmountable theoretical and technological challenges in the protection of the defender and the target against the utilization of internal vulnerabilities or backdoors as well as in dealing with attack scenarios based on backdoor activated collaboration from both inside and outside no matter how augmented or accumulated protective measures are adopted Therefore it is urgent to jump out of the stereotyped thinking based on conventional defense theories and technologies find new theories and methods to effectively reduce the utilization of vulnerabilities and backdoors of the targets without relying on the priori knowledge and feature information and to develop new technological means to offset uncertain threats based on unknown vulnerabilities and backdoors from an innovative perspective This book provides a solution both in theory and engineering implementation to the difficult problem of how to avoid the uncontrollability of product security caused by globalized marketing COTS and non trustworthy software hardware sources It has been proved that this revolutionary enabling technology has endowed software hardware products in IT ICT CPS with endogenous security functions and has overturned the attack theories and methods based on hardware software design defects or resident malicious codes This book is designed for educators theoretical and technological researchers in cyber security and autonomous control and for business technicians who are engaged in the research on developing a new generation of software hardware products by using endogenous security enabling technologies and for other product users Postgraduates in IT ICT CPS ICS will discover that as long as the law of structure determines the nature and architecture determines the security is properly used the problem of software hardware design defects or malicious code embedding will become the swelling of Achilles in the process of informationization and will no longer haunt Pandora's box in cyberspace Security and opening up advanced progressiveness and controllability seem to be contradictory but there can be theoretically and technologically unified solutions to the problem
