Conservation Of Living Nature And Resources Problems Trends And Prospects:

Conservation of Living Nature and Resources Alexey V. Yablokov, Sergey A. Ostroumov, 2013-06-29 This book is based on our two books published in the USSR and translated in a number of other countries Conservation of living nature problems and perspectives 1983 and The levels of conservation of living nature 1985 It differs from the vast majority of the numerous books on conservation and environment which are mainly devoted either to specific problems of conservation of certain taxons or to problems of conservation of prescribed regions or to general issues of environmental conservation in toto while the problems of the conservation of living nature are represented only to a small degree Our book is one of the volumes at present not numerous that place a high value on the diversity of living nature as the basis for the existence and development of mankind on the Earth Living nature besides its own intrinsic value at all times was is now and will ever remain the sole unique and indispensable resource and provider for mankind **Biological Diversity** L. N. Petrov, 2003

One of the cornerstones of life's wonders is the vast array of species filling the planet From plants to animals to humans there is no shortage of beings to provide spice of life variety is said to be Periodically scientists announce the discovery of a new form of life so it seems as if Earth is capable of producing new species just to keep us on our toes At times the immense breadth of living things can even feel overwhelming as one pauses to ponder how numerically insignificant humans are when compared to the insect population Given the biological diversity of the planet it is incumbent upon humans to safeguard the natural beauty of the environment To that end conservation takes on special importance necessitating the balancing of industrial expansion with preserving the flora and fauna surrounding us This book is an important tool in understanding and researching the many different life forms spanning the globe Collected here is a substantial and carefully selected listing of relevant literature on biological diversity and its conservation Following this bibliography are author title and subject indexes to allow for further access to this information The sheer bulk of the works about biological diversity can be so intimidating that a book such as this one becomes useful in sorting through the resources about the importance of life's variety

Biological Effects of Surfactants S.A. Ostroumov, 2005-12-15 Offering a new perspective on the hazards of pollution Biological Effects of Surfactants examines the effects of anionic non ionic cationic surfactants and detergents on a wide range of organisms populations communities and ecosystems The author establishes new quantitative characteristics of the effects and presents study results on newly discovered phenomena While proposing and substantiating new priorities and approaches for testing assessing and characterizing the biological activities and hazards of substances the book illustrates how the data obtained can be used to develop effective environmental remediation and protection measures to improve water quality **Handbook of Climate Change Across the Food Supply Chain** Walter Leal Filho, Ilija Djekic, Sergiy

Smetana, Marina Kovaleva, 2022-04-22 This book presents climate change as a global phenomenon which affects the entire food chain Many studies analyzing environmental impacts of food systems confirm significant effects of food production on

climate change Most of them associate primary production with emission of greenhouse gasses identified as one of the causes resulting in warming the atmosphere and global climate effects A wider perspective shows that the food chains start at farms with consumers being at the end of the pipeline This approach emphasizes the role of the entire food chain highlighting different kinds of environmental impacts affecting climate change On the other side temperature changes and variations of precipitation patterns together with extreme weather events and water reduction are recognized as predictors for producing less food decreased food quality new food safety risks biodiversity losses and depletion of resources associated with food production in modified circumstances Last but not least these effects introduce new threats known as food security where some assumptions stress that almost one billion of people are hungry not receiving enough food as a result of climate changes As a result the UN highlights the need for combating climate change and promotes sustainable food consumption and production Based on the perceived need to promote and disseminate information on climate change related to food system the Handbook of Climate change across the food supply chain is being produced The publication compiles information experiences practical initiatives and projects around the subject matter and makes it available to a wide audience It is expected that the Handbook of Climate change across the food supply chain makes many benefits of climate service clearer and inter alia leads to an increase in the demand for such important services

Segers, K. Martens, 2006-01-20 Freshwater

Biodiversity is a much underestimated component of global biodiversity both in its diversity and in its potential to act as models for fundamental research in evolutionary biology and ecosystem studies Freshwater organisms also reflect quality of water bodies and can thus be used to monitor changes in ecosystem health The present book comprises a unique collection of primary research papers spanning a wide range of topics in aquatic biodiversity studies and including a first global assessment of specific diversity of freshwater animals The book also presents a section on the interaction between scientists and science policy managers A target opinion paper lists priorities in aquatic biodiversity research for the next decade and several reactions from distinguished scientists discuss the relevance of these items from different points of view fundamental ecology taxonomy and systematics needs of developing countries present day biodiversity policy at European and at global scales It is believed that such a platform for the interaction between science and science policy is an absolute necessity for the efficient use of research budgets in the future

William and Mary Environmental Law and Policy Review, 1998 **International Books in Print**, 1997 **Multidimensional Global Change** Kirill I. Kondrat'ev, 1998-07

Multidimensional Global Change Kirill Ya Kondratyev Forty years of technological progress have had a catastrophic impact

on the environment since this progress has been based on the ruthless exploitation of natural resources 20 percent of the fertile soil on cultivated land has been lost 20 per cent of tropical forests have been cleared desertification continues at a rate of 6 million hectares annually and deforestation amounts to 11 million hectares annually Economic estimations practically never take into account this depletion and damage to natural resources the harmful effect on human health the deprivation of future generations of those natural resources and the long term impact in the form of biospheric deformation In this text Kirill Kondratyev emphasises the extremely complex and interdisciplinary nature of multidimensional global change highlighting its principal aspects and many practical consequences economic social etc as well as the relationships between environmental problems on global continental and national scales He demonstrates that the main limiting factor of further quantitative development of humankind is the available biosphere resources and that the basic criterion of ecological well or ill being is the level of depletion of these resources The author highlights an acute social controversy of the modern world in that the level of biospheric resource consumption in industrially developed countries exceeds by far that in the Third World This disparity could be eliminated through advancements such as the decarbonisation of energy production and the development of new technologies However he shows that radical improvement of the situation can only be achieved by reducing the population number and establishing a new fair economic order He emphasises that when considering global change problems it is important to avoid exaggerations and he strikes a balance between the most gloomy predictions and more encouraging estimations Readership Professional scientists environmentalists and engineers concerned with research relating to global change and its consequences managers and senior engineers wishing to gain an insight into the problems caused by global change and undergraduate and postgraduate students of geography meteorology climatology atmospheric physics and environmental science *Mammalia*, 1993 *Biodiversity Studies* Charles Hyde Smith, 2000 Science librarian Smith Western Kentucky U cites literature both on the biological study of diversity itself and on the socio natural science of diversity conservation The main part lists over 5 700 monographs and articles and the second identifies a selection of over 100 special issues of serial publications in which the main theme is related to biodiversity studies The entries include ratings of the number of citations the work has received in the literature and key words The indexes are by general subject geography and organism Annotation copyrighted by Book News Inc Portland OR
