Course 4: Conservation Principles for Continuous Media

Charles J. Glover

Harry L. Jones
Texas A&M University

In an effort to encourage new approaches to teaching engineering, the National Science Foundation has supported the development of four new courses at Texas A&M University (TAMU). These new courses are designed to build a solid foundation for further engineering study and practice and are intended to replace the content normally taught in a set of "core" engineering science courses. This paper addresses key elements of one of these new courses (Course 4). Other elements of the program are discussed elsewhere.¹⁻³

Course 4, to a great extent, parallels course 1. It has four primary objectives, 1) to develop the basic equations of engineering analysis for use with continua, 2) to review properties and behavior of materials from the perspective of continua, 3) to present applications of the basic equations to the analysis and understanding of processes in continua such as heat transfer, fluid mechanics, solid mechanics, and 4) to carry out the above objectives with an emphasis on understanding the physical meaning of the fundamental laws as represented in the mathematical equations. From this perspective, it combines the concepts of course 1 with the mathematical language of multivariable calculus.

In this course we further develop the unifying theme of conservation principles and in doing so further instill in the students the tremendous wealth of information which lies in the beautiful (plus one) of physical laws. The laws are revisited, although on a microscopic scale, to provide details such as temperature profiles associated with heat conduction, stress and strain in deformable solids, and velocity profiles of flowing fluids. As in course 1, it is our objective that students practice approaching problems from a viewpoint of applying the laws, one by one, and asking the questions "What does conserved mass (energy, linear momentum, angular momentum, charge, entropy, mechanical energy, thermal energy, electrical energy, etc.) tell me?". This approach further establishes a strong understanding of the fundamental physical laws and provides students with a foundation for approaching new problems in a creative and conceptual way.

With this perspective a syllabus showing an approximate schedule is shown in Table I. Chapter numbers refer to the textbook developed for the course.⁴ Part I reviews the importance of accounting, the way the laws fit an accounting framework, and other elements that were presented in course 1 and that provide the foundation and structure of engineering analysis and design. If these same concepts are to provide the basis for course 4, then they must be well understood at the outset.

Then, with these perspectives in hand, Part II lays out in detail the mathematical statements of the conservation laws, just as was done in course 1 but for microscopic (differential) size systems. First, is the conservation of mass, second conservation of charge, then linear mo-

mentum, angular momentum, energy, and the second law of thermodynamics. The same topics are covered in the same order, and even in chapters with the same numbers as were covered in course 1. In each of these segments not only are the basic laws stated but also accounting statements which may be used to count subject mass, charge, energy, etc. which are not conserved are also introduced. Additionally, problems are presented and assigned to the students that introduce the application of the concepts on a differential scale. For example, in chapter 6 on angular momentum, Mohr's circle is introduced as a technique for easily determining the normal and shear stresses which act on a plane of specified orientation in a body for a given state of stress. Conservation of angular momentum results in symmetry of the stress tensor, which in turn leads to the Mohr's circle technique. This technique is reintroduced in chapter 12 in elasticity applications. It is intended that these sections of the course be quite complete with respect to providing the basic relationships that are required to apply the laws to physical situations. Consequently, these
