

WHAT IS A **CONSTANT**?

In mathematics, a **constant** refers to a fixed value that does not change throughout a particular equation or problem. *It remains the same regardless of other variables or inputs.*

For example, in the equation $y=3x+5$, the constant is 5 because it always stays the same, while the variable x and its coefficient 3 can vary. Constants are important in mathematical calculations, as they provide stability and serve as reference points for solving equations, graphing functions, and performing various mathematical operations.

The diagram shows the equation $3x + 5$ in large, bold font. The number 3 is black, x is orange, + is black, and 5 is orange. An arrow points from the word "Coefficient" to the number 3. Another arrow points from the word "Constant" to the number 5.

$$\text{Coefficient} \rightarrow 3x + 5 \leftarrow \text{Constant}$$

Variational and Level Set Methods in Image Segmentation Amar Mitiche, Ismail Ben Ayed, 2010-10-22 Image segmentation consists of dividing an image domain into disjoint regions according to a characterization of the image within or in between the regions Therefore segmenting an image is to divide its domain into relevant components The efficient solution of the key problems in image segmentation promises to enable a rich array of useful applications The current major application areas include robotics medical image analysis remote sensing scene understanding and image database retrieval The subject of this book is image segmentation by variational methods with a focus on formulations which use closed regular plane curves to define the segmentation regions and on a level set implementation of the corresponding active curve evolution algorithms Each method is developed from an objective functional which embeds constraints on both the image domain partition of the segmentation and the image data within or in between the partition regions The necessary conditions to optimize the objective functional are then derived and solved numerically The book covers within the active curve and level set formalism the basic two region segmentation methods multiregion extensions region merging image modeling and motion based segmentation To treat various important classes of images modeling investigates several parametric distributions such as the Gaussian Gamma Weibull and Wishart It also investigates non parametric models In motion segmentation both optical flow and the movement of real three dimensional objects are studied
