Contaminated Forests - Recent Developments in Risk Identification and Future Perspectives I. Linkov, 1999

Contaminated Forests Igor Linkov, William R. Schell, 2012-05-29 Concentrations of pollutants in the atmosphere have increased dramatically over the last century and many of these changes are attributable to anthropogenic activities The influence of acid rain has been well studied but there has been no extensive exploration of other pollutants such as toxic chemicals heavy metals and radionuclides Natural ecosystems especially forests tend to accumulate many of these pollutants which subsequently can affect ecosystem health These contaminants may be very damaging to the environment in Eastern Europe where the rapid disappearance of forest is the result not only of contamination but also of poor forest management practices The current book is designed to reduce the uncertainty in our current knowledge of forest radioecology The three topics it embraces are a Modelling b Measurements and Data and c Countermeasures and Risk Assessment *Assessment and Management of Environmental Risks* Igor Linkov, José Palma-Oliveira, 2012-12-06 Managing environmental contamination requires decision makers to weigh existing risks against the potential effects of implementing environmental policies considering both the benefits and disruptions that may result from different actions The NATO Advanced Research Workshop in Lisbon was an important step in the development and application of cost efficient methods of risk assessment especially within the constraints of a budget The goal of the workshop was to evaluate the potential for risk assessment to serve as a unified and unifying technique in addressing a wide range of environmental problems Papers presented in this book discuss issues ranging from specific and local studies specific site ecosystem pollutant to global decision and management frameworks watersheds regions integration of multiple pollutants and stressors they develop a range of approaches starting from specific methods to widely applied public policies Figure 1 The papers show that the use of risk assessment can provide the scientific basis for environmentally sound and cost efficient policies strategies and solutions to our environmental challenges The organization of the Proceedings reflects sessions and discussions during the workshop The papers in the introductory Chapter summarize the positions of Drs Glenn Suter EPA and Jim Wilson Resources for the Future regarding whether the use of often expensive risk assessments in developing countries can be justified given evolving regulatory institutions and limited resources *Remediation of Contaminated Environments*, 2009-05-12 Remediation of Contaminated Environments summarises amongst other things what happened to the people and environment around Chernobyl and other nuclear sites and what measures need to be taken in future in the event of nuclear accidents etc plus it has a very important and currently topical use in detailing what to do in the event of a terrorist dirty bomb attack on a city Remediation including characterization of contaminated sites safety requirements remediation planning effectiveness of individual measures in different environments social ethical and economic considerations application of modern decision aiding technologies Applicable to different categories of contaminated environments and contaminants comprising areas contaminated by

radiation accidents and incidents nuclear weapon tests natural radionuclides associated with nuclear fuel cycle fossil material mining and gas and oil production Associated side effects environmental and social and human based remediation measures comprising perception of this activity by the population with particular regard to stakeholders and population involvement in making decisions on environmental safety and remediation of contaminated sites *Advanced Science and Technology for Biological Decontamination of Sites Affected by Chemical and Radiological Nuclear Agents* Nelson Marmiroli, Borys Samotokin, Marta Marmiroli, 2007-05-03 Pollution of soils and waters by human activities is an important and widespread problem This pollution by organic and inorganic substances can affect individual organisms human populations and ecosystems each in its own unique way In particular former military installations often used for weapons production and nuclear power plants represent a ongoing and substantial threat to environment and human health because of the specific pollutants that can be released Solvents explosives fuels radionuclides heavy metals and metalloids all have been identified in the environment around these installations Remediation technologies for these contaminated sites have been developed based on conventional systems utilising physical and chemical treatments such as excavation and incineration pump and treat methods ultraviolet oxidation soil washing etc These approaches are usually very expensive and can involve the removal of large amounts of soil or water which often leads to resources depletion and limitation in the future utilisation of the site Recently new decontamination approaches based on living organisms in particular micro organisms and plants have been researched and developed as a more sustainable alternative because they have lower costs reduced environmental impacts and increased public acceptance Development of biological decontamination techniques has been carried out in several laboratories and research institutions worldwide and practical applications on contaminated sites have been recorded in several countries In the USA and Canada several commercial companies have been utilizing these approaches for years alongside conventional techniques with great success a good examples can be found is in the U S Radionuclide Uptake In Food And Consequences For Humans Dharmendra Kumar Gupta, Clemens Walther, 2025-01-17 This book provides a comprehensive review on how radionuclides occur in the environment how radionuclides are distributed in soil how the migration of radionuclides in plants occurs and their consequences on human health It explains how the speciation of radionuclide interferes in the uptake and accumulation processes in fruits and includes case studies as well as reviews of modern and state of the art technology related to radioactive material uptake in plants This volume is a useful reference to researchers in the field of radionuclide contamination in foods and will also be helpful for graduate and undergraduate students specializing in radioactive waste disposal and its toxicity effects in food products and their consequences on humans *Equidosimetry* F. Bréchnac, G. Desmet, 2007-05-22 Considerable experience with radioecological and related ecological research on terrestrial and aquatic ecosystems has been achieved especially after the Chernobyl accident The combined effects of the radiation chemical and biological factors after a contamination of the environment and during its remediation

have shown an interactive complexity that highlights the need for equidosimetrical evaluations of the influence of the various stressors and the need for their ecological normalization In radioecology and radiation protection methods of radiation dosimetry are key for dose assessment It is therefore highly desirable to develop a clear theoretical approach as well as a practical method of equidosimetry that would allow for an ecological normalization of the different stressors in unified uniform units especially for comparison purposes **Environmental Reviews** ,2002 **Information Report** ,1985
