Communication By Chemical Signals:

Communication by Chemical Signals James W. Johnston, David G. Moulton, Amos Turk, 1970 **Chemical Signals in Vertebrates 9** Anna Marchlewska-Koj, John J. Lepri, Dietland Müller-Schwarze, 2001-12-31 It is generally accepted that the recent progress in molecular and cellular biology would not have been possible without an understanding of the mechanisms and signaling pathways of communication inside the cell and between various cells of the animal organism. In fact, a similar progress occurred in the field of chemical communication between individual organisms of vertebrate species and this volume is aimed at presenting the current state of the art on this subject. The reader can find here both original results obtained in the laboratory or field studies and comprehensive reviews summarizing many years of research. The presentations of over 60 scientists have been grouped according to their approach into nine parts covering such fields as ecological and evolutionary aspects of chemical communication, structure and neuronal mechanisms of chemosensory systems, chemical structure of pheromones and binding proteins, kin, individual and sexual recognition, predator-prey relationships, purpose and consequences of marking behavior, scent signals and reproductive processes. Expanding on former volumes of this series, entirely new chapters have been added on prenatal chemical communication describing specific effects of the intrauterine environment. In many cases, a truly multidisciplinary approach was required, such as with the population analysis of polymorphic variants of the mouse's major urinary proteins that function in carrying pheromones. *Chemical Signals in Vertebrates 4* David Duvall, Dietland Müller-Schwarze, Robert M. Silverstein, 2012-12-06 This volume reviews recent developments in our understanding of chemical signaling in vertebrates. After sections dealing with general principles and chemical aspects of vertebrate pheromones, it follows a taxonomic approach progressing from fish to mammals. The editors asked a diverse international group of leading investigators working on a wide array of vertebrate taxa and specific issues to consider their efforts from comparative evolutionary and ecological viewpoints. The relative number of manuscripts in each part does not necessarily reflect current intensity of research, since the editors invited speakers who together would provide a balanced and comprehensive overview while avoiding duplication. Still, the part on mammals is the longest. Fourth in a series dating from 1977, this volume illuminates current trends and likely future developments in the field of chemical signaling in vertebrates. Going back even farther, the first chapter, a personal account of the past quarter century by Dr. Mykietowycz, recalls the most important milestones, such as symposia or the founding of societies and journals. He also credits those investigators who stand out by their seminal studies. Communication by Chemical Signals, 1970 Chemical Communication William C. Agosta, 1992-04-15 A wounded minnow attempts to rejoin its school and the other minnows scatter in panic; a single beetle finds a pine tree to its liking and soon thousands of beetles swarm that tree; and others in the vicinity. A male Syrian golden hamster is drawn along an invisible trail to a burrow where a female hamster awaits him ready for mating. These animals are responding to received communications, but as in countless other occurrences in nature, the

language is not auditory or visual it is chemical Unlike humans who gather information largely through sight and sound most living creatures rely heavily on chemical compounds from other organisms for their basic knowledge of the world Among the various types of these compounds are the chemical signals exchanged between members of the same species that govern social interactions crucial to survival These signals are called pheromones from the Greek *pherein* to carry and *hormon* exciting and they are used to send warnings establish territorial boundaries provoke aggression control sexual behavior and locate food In this volume organic chemist William C Agosta explores the chemistry of pheromones and the mechanisms by which they orchestrate animal behavior Professor Agosta details the intricate process of identifying pheromones and determining the active components within these sometimes highly complex mixtures He also demonstrates the value of this growing body of knowledge to our understanding of evolution ecology human behavior and agricultural production The result is a fascinating look at a research area that brings together investigators information technologies and procedures from the fields of biology chemistry and behavioral science Chemical Communication spans the entire spectrum of life from simple organisms such as water molds and brown algae to insects birds fish reptiles mammals and in a provocative final chapter human beings Along the way Dr Agosta provides dozens of captivating examples of pheromones in action certain male red sided garter snakes which increase their chances of mating successfully by impersonating a female thus distracting rivals or the bolas spiders which capture male moths by hitting them with an adhesive ball on a string after emitting a female moth pheromone that lures the males within range The book also includes important evidence that pheromones alter physiology as well as behavior For example young female mice reach maturity at an accelerated pace after constant exposure to adult male mice

Chemical Signals in Vertebrates 14 Christina D. Buesching, 2019-07-19 In August 2017 the Chemical Signals in Vertebrates CSiV group held its 14th triennial meeting at Cardiff University in Wales This well established international conference brings together leaders and students in the field of olfactory communication and chemical signaling of vertebrates to present new advances in their research as well as synopses of disparate areas under new angles This volume is a collection of the proceedings of this meeting authored by leading experts in this field that covers a wide variety of topics in chemical ecology

Chemical Signals D. Muller-Schwarze, 2012-12-06 Research on chemical communication in animals is in a very active and exciting phase more species are studied data are accumulating concepts are changing and practical application seems feasible While most of the work on chemical ecology and chemical signals deals with insects vertebrate communication provides a formidable challenge and progress has been slow Joint efforts and frequent direct contacts of ecologists behaviorists psychologists physiologists histologists and chemists are required Such an interdisciplinary exchange of information took place on the occasion of the Symposium on Chemical Signals in Vertebrates and Aquatic Animals in Syracuse New York from May 31 to June 2 1979 More than one hundred investigators from seven countries participated and the papers presented comprise this volume Since the first Symposium on Vertebrate Chemical Signals at Saratoga Springs in

1976 considerable progress has been made with field studies the physiology of the vomeronasal organ and its role in reproductive behavior The behavioral functions and chemical nature of priming pheromones are better understood Efforts to isolate and identify mammalian pheromones are gaining ground and the bioassays are becoming more sophisticated In addition to formal presentations one evening of the Symposium was devoted to round table discussions of particular topics The selected themes indicate the growing points of chemical communication research priming pheromones vomeronasal organ bioassay and practical applications *Chemical Signals in Vertebrates* 13 Bruce A. Schulte, Thomas E. Goodwin, Michael H. Ferkin, 2015-12-09 In 2014 the Chemical Signals in Vertebrates CSiV group held its 13th triennial meeting in conjunction with the 30th meeting of the International Society of Chemical Ecology ISCE The meeting convened on the campus of the University of Illinois at Urbana Champaign This meeting was the first held jointly with these two groups which share common history and are dedicated to understanding the role of chemical communication in the lives of organisms This volume is a collection of the proceedings of this meeting and like the meeting cover a variety of topics in chemical ecology including Chemical Ecology of Social Behavior Chemical Signals Analysis and Synthesis Evolution Genomics and Transcriptomics of Chemical Signals Molecular Mechanisms of Semiochemical Perception and Processing Multimodal Communication and Neuroethology and Neurophysiology *Pheromones and Animal Behavior* Tristram D. Wyatt, 2014 **Advances in Chemoreception** James W. Johnston, 2012-04-26 Research on the chemical senses has been growing at a remarkable rate over the last decade This growth has greatly expanded our understanding of the electrical properties and ultrastructure of chemosensory organs of the role of chemoreception in the control of behavior of the organization of higher centers in the chemosensory pathways and of the chemical constituents of mixtures of biologic significance But one area where advances have been especially impressive is concerned with the properties of pheromones and substances with similar biologic effects Pheromones are compounds produced by certain animals which have the effect of inducing one or more specific responses within members of the same or closely related species Some of these substances the primer pheromones act on the endocrine system probably through the central nervous system The pregnancy block induced in mice by the odor of strange males is a striking example Others such as signalling or releaser pheromones elicit an immediate behavioral response Sex attractants are prominent examples of this group While the chemical identity of these compounds is known in a relatively few cases and these mainly in insects we now have extensive information about their impact on the receiving organism at the receptor physiologic and behavioral levels **Chemical Signals in Vertebrates** Dietland Muller-Schwarze, 2012-12-06 From June 6 to 9 1976 about 140 participants physiologists chemists ecologists animal behaviorists and psychologists gathered in the Gideon Putnam Hotel at Saratoga Springs New York for a symposium entitled Chemical Signals in Vertebrates The focus of this symposium sponsored by the United States National Science Foundation was on chemical communication in higher animals most notably mammals This included the chemical nature production and

reception of chemical signals and their modulating effects on behavior Almost all the world's laboratories working in this area were represented It was the first meeting of its kind and although the physiological aspects of taste and smell on the one hand and insect pheromones on the other have previously been treated in several fine symposia they have not before been treated as a back drop to chemical communication in vertebrates The field of insect pheromones is well developed with hundreds of active compounds identified By contrast in vertebrates only six mammalian pheromones in as many species had been identified chemically by 1976 *Pheromones and Animal Behavior* Tristram D. Wyatt, 2014-01-23 This book explains how animals use chemical communication emphasising the evolutionary context and covering fields from ecology to neuroscience and chemistry *Chemical Signals in Vertebrates* 11 Jane Hurst, Robert J. Beynon, S. Craig Roberts, Tristram Wyatt, 2007-10-26 This volume contains the proceedings of the conference of the same name held in July 2006 at the University of Chester in the United Kingdom It includes all the latest research on chemical communication relevant to vertebrates particularly focusing on new research since the last meeting in 2003 Topics covered include the chemical ecology biochemistry behavior olfactory receptors and the neurobiology of both the main olfactory and vomeronasal systems of vertebrates **Advances in Chemical Signals in Vertebrates** Robert E. Johnston, Dietland Müller-Schwarze, Peter W. Sorenson, 2012-12-06 The field of olfactory research and chemical communication is in the early stages of revolutionary change and many aspects of this revolution are reflected in the chapters in this book Thus it should serve admirably as an up to date reference First a wide range of vertebrate groups and species are represented Second there are excellent reviews of specific topics and theoretical approaches to communication by odors including chapters on signal specialization and evolution in mammals the evolution of hormonal pheromones in fish alarm pheromones in fish chemical repellents the chemical signals involved in endocrine responses in mice and the controversy over human pheromones Third there are exciting new findings presented in numerous specific topic areas such as the chemistry of pheromones in a wide range of species salamanders to elephants the chemistry of proteins that control the release of pheromones the molecular biology and physiology of detection coding and response to odor signals the effects of experience on sensitivity to odors the role of genes of the immune system in odor production and in human mate choice the function and perception of scent over marks the recognition of individuals and kin by odors the influence of odors on predator prey interactions and the use of odors to help control pests This book is an offshoot of the Eighth International Symposium on Chemical Signals in Vertebrates held at Cornell University in Ithaca New York July 20-25 1997 hosted and organized by Bob Johnston *Chemical Signals in Vertebrates* 3 Dietland Müller-Schwarze, Robert M. Silverstein, 2013-11-21 The first volume in this series appeared in 1977 the second in 1980 From these volumes and the present one some research trends in chemical communication can be perceived In the 1977 volume studies on 13 animal taxa were reported In the present volume the number is 25 This taxonomic diversification of research since the first volume of this series demonstrates the wide variety of ecological

adaptions although no new general principles of chemical communication have emerged Further more divergences in chemical communication below the species level have become more apparent In general more sophisticated observations and techniques have led to greater awareness of the complexities in chemical communication As such awareness has also developed in the field of insect chemical communication there has been a corresponding increase in the identification of the chemical compounds involved However in the vertebrates no such correlation exists in the present volume conclusive chemical identifications of semiochemicals are remarkable by their paucity

Chemical Signals in Vertebrates 10 R.T. Mason, Michael P. Lemaster, Dietland Müller-Schwarze, 2006-11-09 The editors and contributors to this volume should be justifiably proud of their participation in the tenth triennial meeting of the Chemical Signals in Vertebrates International Symposium This meeting was held 27 years after the initial gathering of participants in Saratoga Springs New York from June 6 to 9 1976 Subsequent meetings have been held every three years in Syracuse New York Sarasota Florida Laramie Wyoming Oxford England Philadelphia Pennsylvania Tübingen Germany Ithaca New York and Krakow Poland This tenth anniversary symposium was held from July 29 through August 1 in Corvallis Oregon and was hosted by the Zoology Department and Biology Programs of Oregon State University This book also represents the tenth in a series of books on chemical communication chemical ecology olfactory and vomeronasal research in vertebrate species The species covered in the chapters herein range from fish to mammals including humans By taxonomic breakdown the mammals are the most represented in number of species and chapter contributions However the hosts of the meeting endeavored to have some representative contributions covering all of the major vertebrate taxa As in past years the meeting was well represented with just over 100 participants from 13 different nations Plenary talks focused on some of the non mammalian groups that have tended to be less represented in these symposia Thus we had a very nice overview of comparisons and contrasts of invertebrate chemical communication to vertebrate systems

Neurobiology of Chemical Communication Carla Mucignat-Caretta, 2014-02-14 Intraspecific communication involves the activation of chemoreceptors and subsequent activation of different central areas that coordinate the responses of the entire organism ranging from behavioral modification to modulation of hormones release Animals emit intraspecific chemical signals often referred to as pheromones to advertise their presence to members of the same species and to regulate interactions aimed at establishing and regulating social and reproductive bonds In the last two decades scientists have developed a greater understanding of the neural processing of these chemical signals Neurobiology of Chemical Communication explores the role of the chemical senses in mediating intraspecific communication Providing an up to date outline of the most recent advances in the field it presents data from laboratory and wild species ranging from invertebrates to vertebrates from insects to humans The book examines the structure anatomy electrophysiology and molecular biology of pheromones It discusses how chemical signals work on different mammalian and non mammalian species and includes chapters on insects *Drosophila* honey bees amphibians mice
