**Communities and Ecosystems** David A.

Wardle, 2013-02-15 Most of the earth's terrestrial species live in the soil. These organisms, which include many thousands of species of fungi and nematodes, shape aboveground plant and animal life as well as our climate and atmosphere. Indeed, all terrestrial ecosystems consist of interdependent aboveground and belowground compartments. Despite this, aboveground and belowground ecology have been conducted largely in isolation. This book represents the first major synthesis to focus explicitly on the connections between aboveground and belowground subsystems and their importance for community structure and ecosystem functioning. David Wardle integrates a vast body of literature from numerous fields, including population ecology, ecosystem ecology, ecophysiology, ecological theory, soil science, and global change biology, to explain the key conceptual issues relating to how aboveground and belowground communities affect one another and the processes that each component carries out. He then applies these concepts to a host of critical questions, including the regulation and function of biodiversity as well as the consequences of human-induced global change in the form of biological invasions, extinctions, atmospheric carbon dioxide enrichment, nitrogen deposition, land use change, and global warming. Through ambitious theoretical synthesis and a tremendous range of examples, Wardle shows that the key biotic drivers of community and ecosystem properties involve linkages between aboveground and belowground food webs, biotic interaction, the spatial and temporal dynamics of component organisms, and ultimately the ecophysiological traits of those organisms that emerge as ecological drivers. His conclusions will propel theoretical and empirical work throughout ecology.

**Communities and Ecosystems** Robert H. Whittaker, 1972      **Entrepreneurial Communities and Ecosystems** Morgan R. Clevenger, Michael W-P Fortunato, 2022-06-24

*Entrepreneurial Communities and Ecosystems: Theories in Culture, Empowerment, and Leadership* examines the deep sociocultural dynamics supporting effective and emergent entrepreneurial ecosystems and communities for a new generation of ecosystem builders and researchers. The book provides current theories and discussion with relevant examples regarding culture, empowerment, and leadership in entrepreneurship to build more entrepreneurial communities anywhere, beginning with any set of local advantages. It clarifies the role of community in building an entrepreneurial ecosystem and expands the theory on how entrepreneurial communities and ecosystems differ and how they relate. The book also illuminates the often-avoided discussion about power, with special attention to diversity, with examples of Black women and LGBTQ+ entrepreneurship. It provides a deep dive into the range of formal and informal education, framed as entrepreneurship, ties the importance of entrepreneurship and entrepreneuring to resources available at the community, state, and national levels, and introduces a new concept, omnipreneurship, which puts the skills of entrepreneurship in the service of global benefit and everyday action. This research volume will be equally useful as an undergraduate or graduate text on the sociology of entrepreneurs and entrepreneurship as it is a field guide for ecosystem builders, policy makers, nonprofits, and

entrepreneurship and social researchers worldwide

**Individual-Based Models and Approaches In Ecology** D. L.

DeAngelis, 2018-01-18 Until fairly recently populations were handled as homogenized averages which made modeling feasible but which ignored the essential fact that in any population there is a great variety of individuals of different ages sizes and degrees of fitness Recently because of the increased availability of affordable computer power approaches have been developed which are able to recognize individual differences Individual based models are of great use in the areas of aquatic ecology terrestrial ecology landscape or physiological ecology terrestrial ecology landscape or physiological ecology and agriculture This book discusses which biological problems individual based models can solve as well as the models inherent limitations It explores likely future directions of theoretical development in these models as well as currently feasible management applications and the best mathematical approaches and computer languages to use The book also details specific applications to theory and management

**The Theory of Ecological Communities** Mark Vellend, 2016-09-06

A plethora of different theories models and concepts make up the field of community ecology Amid this vast body of work is it possible to build one general theory of ecological communities What other scientific areas might serve as a guiding framework As it turns out the core focus of community ecology understanding patterns of diversity and composition of biological variants across space and time is shared by evolutionary biology and its very coherent conceptual framework population genetics theory The Theory of Ecological Communities takes this as a starting point to pull together community ecology's various perspectives into a more unified whole Mark Vellend builds a theory of ecological communities based on four overarching processes selection among species drift dispersal and speciation These are analogues of the four central processes in population genetics theory selection within species drift gene flow and mutation and together they subsume almost all of the many dozens of more specific models built to describe the dynamics of communities of interacting species The result is a theory that allows the effects of many low level processes such as competition facilitation predation disturbance stress succession colonization and local extinction to be understood as the underpinnings of high level processes with widely applicable consequences for ecological communities Reframing the numerous existing ideas in community ecology The Theory of Ecological Communities provides a new way for thinking about biological composition and diversity

*Ecosystem Management* Gary Meffe, Larry Nielsen, Richard L. Knight, Dennis Schenborn, 2012-08-31 Today's natural resource managers must be able to navigate among the complicated interactions and conflicting interests of diverse stakeholders and decisionmakers. Technical and scientific knowledge though necessary are not sufficient. Science is merely one component in a multifaceted world of decision making. And while the demands of resource management have changed greatly, natural resource education and textbooks have not. Until now *Ecosystem Management* represents a different kind of textbook for a different kind of course. It offers a new and exciting approach that engages students in active problem solving by using detailed landscape scenarios that reflect the complex issues and conflicting interests that face today's resource managers and scientists. Focusing on the application of the sciences of ecology and conservation biology to real world concerns, it emphasizes the intricate ecological, socioeconomic, and institutional matrix in which natural resource management functions and illustrates how to be more effective in that challenging arena. Each chapter is rich with exercises to help facilitate problem based learning. The main text is supplemented by boxes and figures that provide examples, perspectives, definitions, summaries, and learning tools along with a variety of essays written by practitioners with on the ground experience in applying the principles of ecosystem management. Accompanying the textbook is an instructor's manual that provides a detailed overview of the book and specific guidance on designing a course around it. Download the manual here. *Ecosystem Management* grew out of a training course developed and presented by the authors for the U.S. Fish and Wildlife Service at its National Training Center in Shepherdstown, West Virginia. In 20 offerings to more than 600 natural resource professionals, the authors learned a great deal about what is needed to function successfully as a professional resource manager. The book offers important insights and a unique perspective derived from that invaluable experience.

Community Ecology Peter J. Morin, 2009-04-13 Community ecology, the study of the patterns and processes involving two or more species, has developed rapidly in the last two decades, driven by new and more sophisticated research techniques, advances in mathematical theory and modeling, and the increasing pressure on the environment wrought by humans. Once a purely descriptive science, it is now one of the most forward looking areas of scientific inquiry. Morin skillfully guides the reader through the main tenets and central concepts of community ecology: competition, predation, food webs, indirect effects, habitat selection, diversity, and succession. In an attempt to introduce the reader to the most balanced coverage possible, Morin includes examples drawn from both the aquatic and terrestrial realm and from both plant and animal species. Balancing theory with experimentation and drawing on exciting new studies to complement the historical foundations of the discipline, he also stresses that both the empirical and theoretical approaches are necessary to drive ecology forward into the new millennium. The final chapter on applied community ecology ably demonstrates how community

ecological processes have a wide environmental relevance Although in its infancy the application of community ecology to emerging problems in human dominated ecosystems could mitigate problems as diverse as management strategies for important diseases transmitted by animals and the restoration and reconstruction of viable communities Required reading for all students and practitioners interested in community phenomena Community Ecology marks an important contribution to the development of this protean discipline The first serious textbook for a decade on one of the keystone subdisciplines of ecology Broad taxonomic and habitat coverage Section on implications of community ecology for environmental issues
