The AI Revolution Daniel Vargas-Gomez,2025-09-26 This book examines AI s transformative impact on creativity blending insights from economics media studies and technology to analyze

its role in the arts and the broader creative industries AI challenges the way we relate and use technology as well as expand how we think of technological progress overall Structured in three parts the book first rethinks creativity as an inclusive collaborative process through theories like Actor Network Theory arguing AI is a new form of agency within creative networks It explores the economic drivers of AI adoption citing industry forecasts long term trends and the rise of what sociologist Richard Florida calls the Creative Class Through critical analysis of the gaps between the rhetoric and realities of AI the text advocates for Augmented Creativity as the right approach to balance human AI collaboration Lastly the book studies pragmatic scenarios for 2035 focusing on job shifts AI generated content and artistic experimentation avoiding speculative AI hype By grounding debates in real world impacts the book urges a critical yet nuanced view of AI that ensures it remains a potential agent for collaboration rather than a replacement of human skill and imagination

Generative Adversarial Networks for Content Creation Hung-Yu Tseng, 2021 Content creation aims to make the information i.e. ideas thoughts accessible to the audience through mediums such as posters movies advertisements or any type of art However it is a herculean task for people without years of professional experience to effectively convey the information In recent years visual content creation techniques based on generative adversarial networks GANs have made significant progress on facilitating the content creation process By learning from the data these approaches produce appealing content creation and editing results Nevertheless it remains challenging for the GAN based methods to 1 provide a controllable creation editing process for the user and 2 learn from limited data for the content creation tasks In this thesis we investigate several solutions to address the above issues We first propose a multi modal image to image translation framework that learns from the unpaired data We then leverage the image to image translation approaches to model the professional workflow of a particular content creation task We also design a differentiable retrieval scheme to gain the controllability of the conditional image synthesis model Finally we propose a regularization term to learn the GAN models under the limited training data

First of all we propose an Image to Image translation framework that can 1 produce one to many translation results and 2 learn from unpaired data across various image domains Specifically the model disentangles images into a domain invariant content space and a domain specific attribute space to enable one to many translation On the other hand a cross cycle consistency loss function is used to train the model with unpaired data Furthermore we design a mode seeking regularization term to increase the diversity of the generated images Second we construct a system capable of modeling the progressive workflow for a particular type of artwork By leveraging a series of image to image translation networks to learn the progressive creation steps our model enables both multi stage image generation and multi stage editing of an existing piece of art Moreover we design an optimization process to address the reconstruction issue in the editing scenario Third we develop a differentiable retrieval approach to select real image patches as the reference for the image synthesis task With our differentiable retrieval approach we can 1 make the entire pipeline retrieval and generation end to end trainable and 2

encourage the selection of mutually compatible patches for the same generated image Furthermore we design two auxiliary loss functions to facilitate the training of the retrieval function Finally we propose a regularization term to train the GAN models on limited data We theoretically and empirically show that our scheme 1 improves the generalization performance and stabilizes the learning dynamics of GAN models under limited training data and 2 complements the recent data augmentation solutions
