Mobile Agents for Telecommunication Applications Eric Horlait, 2003-07-31 Mobile agents refer to self-contained and identifiable computer programs that can move within the network and can act on behalf of the user or another entity Most of the current research work on the mobile agent paradigm has two general goals: reduction of network traffic and asynchronous interaction These two goals stem directly from the desire to reduce information overload and to efficiently use network resources There are certainly many motivations for the use of a mobile agent paradigm However, intelligent information retrieval, network and mobility management, and network services are currently the three most cited application targets for a mobile agent system The aim of the workshop is to provide a unique opportunity for researchers, software and application developers, and computer network technologists to discuss new developments in the mobile agent technology and applications After last year's very successful workshop in Ottawa, Canada, 110 attendees, this year's workshop will focus on mobile agent issues across the areas of network management, mobile applications, nomadic computing, e-commerce, ad hoc networks, and applications, feature interactions, Internet applications, QoS, management, policy-based management, interactive multimedia, and computer telephony integration

Human-Robot Interactions in Future Military Operations Florian Jentsch, 2016-05-23 Soldier robot teams will be an important component of future battle spaces, creating a complex but potentially more survivable and effective combat force The complexity of the battlefield of the future presents its own problems The variety of robotic systems and the almost infinite number of possible military missions create a dilemma for researchers who wish to predict human-robot interactions HRI performance in future environments Human-Robot Interactions in Future Military Operations provides an opportunity for scientists investigating military issues related to HRI to present their results cohesively within a single volume The issues range from operators interacting with small ground robots and aerial vehicles to supervising large, near-autonomous vehicles capable of intelligent battlefield behaviors The ability of the human to team with intelligent unmanned systems in such environments is the focus of the volume As such, chapters are written by recognized leaders within their disciplines and they discuss their research in the context of a broad-based approach Therefore, the book allows researchers from differing disciplines to be brought up to date on both theoretical and methodological issues surrounding human-robot interaction in military environments The overall objective of this volume is to illuminate the challenges and potential solutions for military HRI through discussion of the many approaches that have been utilized in order to converge on a better understanding of this relatively complex concept It should be noted that many of these issues will generalize to civilian applications as robotic technology matures An important outcome is the focus on developing general human-robot teaming principles and guidelines to help both the human factors design and training community develop a better understanding of this nascent but revolutionary technology Much of the research within the book is based

on the Human Research and Engineering Directorate HRED U S Army Research Laboratory ARL 5 year Army Technology Objective ATO research program The program addressed HRI and teaming for both aerial and ground robotic assets in conjunction with the U S Army Tank and Automotive Research and Development Center TARDEC and the Aviation and Missile Development Center AMRDEC The purpose of the program was to understand HRI issues in order to develop and evaluate technologies to improve HRI battlefield performance for Future Combat Systems FCS The work within this volume goes beyond the research results to encapsulate the ATO s findings and discuss them in a broader context in order to understand both their military and civilian implications For this reason scientists conducting related research have contributed additional chapters to widen the scope of the original research boundaries **Unified Communications**
