Viterbi, Jim K. Omura, 2013-04-22 Written by two distinguished experts in the field of digital communications this classic text remains a vital resource three decades after its initial publication Its treatment is geared toward advanced students of communications theory and to designers of channels links terminals modems or networks used to transmit and receive digital messages The three part approach begins with the fundamentals of digital communication and block coding including an analysis of block code ensemble performance. The second part introduces convolutional coding exploring ensemble performance and sequential decoding The final section addresses source coding and rate distortion theory examining fundamental concepts for memoryless sources as well as precepts related to memory Gaussian sources and universal coding Appendixes of useful information appear throughout the text and each chapter concludes with a set of problems the solutions to which are available online **Entropy and Information Theory** Robert M. Gray, 2011-01-27 This book is an updated version of the information theory classic first published in 1990 About one third of the book is devoted to

Shannon source and channel coding theorems the remainder addresses sources channels and codes and on information and distortion measures and their properties New in this edition Expanded treatment of stationary or sliding block codes and their relations to traditional block codes Expanded discussion of results from ergodic theory relevant to information theory Expanded treatment of B processes processes formed by stationary coding memoryless sources New material on trading off information and distortion including the Marton inequality New material on the properties of optimal and asymptotically optimal source codes New material on the relationships of source coding and rate constrained simulation or modeling of random processes Significant material not covered in other information theory texts includes stationary sliding block codes a geometric view of information theory provided by process distance measures and general Shannon coding theorems for asymptotic mean stationary sources which may be neither ergodic nor stationary and d bar continuous channels
