ABSTRACT

In terms of thought disorder, the language of patients with schizophrenia itself could be a valuable resource. Some valuable studies on the language of patients with schizophrenia have been performed. However, most such studies have been confined to English-speaking countries, or at least those where Indo-European languages are spoken. Therefore, we investigated linguistic anomalies in the language of Korean patients with schizophrenia. Short texts written by 49 patients with schizophrenia from a single mental hospital and matched normal control participants were analyzed. We evaluated these texts in terms of semantic and syntactic errors. Then, we compared the error rates adjusted for text length between patients and normal control participants. We also divided the patients with schizophrenia into two groups by their duration of illness and compared these two groups to investigate the relationship between the duration of illness and linguistic anomalies. The patients with schizophrenia committed a total of 1.86 (2.52) semantic errors and 1.37 (1.79) syntactic errors per 100 characters, which were significantly more frequent than errors committed by normal control participants. Furthermore, there was a notably high number of semantic errors relative to syntactic errors in the language of patients with schizophrenia. Our study results are consistent with previous studies from English-speaking countries, implying that the linguistic anomalies of patients with schizophrenia are not confined to a single language. Because language is essential in mental function, further research on linguistic anomalies in patients with schizophrenia is recommended.

1. Introduction

Schizophrenia is a chronic, debilitating disorder characterized by hallucinations, delusions, and disorganized behavior. It has been recognized that the heritability of schizophrenia is around 80 % (Lukker et al., 2018), which strongly indicates that schizophrenia is a heritable, biological disease. Nevertheless, no replicable biomarker has been discovered, despite decades of research (Tandon et al., 2008b; Tandon et al., 2008a). Various research methods, such as neuroimaging, genetic analysis, and electrophysiology, are now being widely used to identify biomarkers of schizophrenia.

In terms of disease markers, the language of patients itself could be a valuable resource (de Boer et al., 2020). In the absence of biological disease markers, psychiatrists diagnose patients as having schizophrenia through clinical interviews, which involve the use of language. Therefore, language could serve as a window for investigating the brain and its pathology (Elverog et al., 2017). Furthermore, “formal thought

disorder” could also be represented as a language disorder, considering that human thought is based on language. It has been suggested that language may constitute the psyche of individuals and, therefore, must play a significant role in the pathophysiology of schizophrenia (Hillem and Roswell, 2015).

Various valuable studies on the language of patients with schizophrenia have been performed. It has long been suggested that patients with schizophrenia appear to have some language deficits (Andreasen, 1979; Delisi, 2001). According to the previous article, which comprehensively reviews language impairment in schizophrenia (Covington et al., 2005), phonology and morphology are generally preserved in patients with schizophrenia. Regarding syntax, it has generally been argued that patients with schizophrenia show relatively preserved syntactic abilities (Ruchaw et al., 2003; Kuperberg, 2010; Stéphane et al., 2014). However, some studies have shown the opposite results (Marini et al., 2008; Moro et al., 2015). Furthermore, numerous studies have consistently shown that patients with schizophrenia make several
