Community Ecology Pattern And Process:

Community Ecology Jiro Kikkawa, Derek John Anderson, 1986 This multi author text has been planned as a companion to the successful volumes on theoretical ecology behavioural ecology and physiological ecology mentioned elsewhere in this catalogue The editors have covered the main approaches in community ecology **Community Ecology** Jiro

Kikkawa, 1986-10-01 *Community Ecology* Jiro Kikkawa, Derek John Anderson, 1986 **Community Ecology** Herman A. Verhoef, Peter J. Morin, 2009-11-26 Community ecology is the study of the interactions between populations of co existing species This book provides a survey of the state of the art in theory and applications of community ecology with special attention to topology dynamics the importance of spatial and temporal scale as well as applications to emerging problems in human dominated ecosystems including the restoration and reconstruction of viable communities It adopts a mainly theoretical approach and focuses on the use of network based theory which remains little explored in standard community ecology textbooks The book includes discussion of the effects of biotic invasions on natural communities the linking of ecological network structure to empirically measured community properties and dynamics the effects of evolution on community patterns and processes and the integration of fundamental interactions into ecological networks A final chapter indicates future research directions for the discipline This book provides ideal graduate seminar course material Parasite Communities: Patterns and Processes Gerald W. Esch, 2012-12-06 We first discussed the possibility of organizing a symposium on helminth communities in June 1986 At that time we were engaged in writing a joint paper on potential structuring mechanisms in helminth communities we disagreed on a number of issues We felt the reason for such debate was because the discipline was in a great state of flux with many new concepts and approaches being introduced with increasing frequency After consider able discussion about the need scope and the inevitable limitations of such a symposium we decided that the time was ripe to bring other ecologists engaged in similar research face to face There were many individuals from whom to choose we selected those who were actively publishing on helminth communities or those who had expertise in areas which we felt were particularly appropriate We compiled a list of potential participants contacted them and received unanimous support to organize such a symposium Our intent was to cover several broad areas fully recognizing that breadth negates depth at least with a publisher s limitation on the number of pages We felt it important to consider patterns amongst different kinds of hosts because this is where we had disagreed among ourselves **Community Ecology** Peter J. Morin, 2011-06-09 All life on earth occurs in natural assemblages called communities Community ecology is the study of patterns and processes involving these collections of two or more species Communities are typically studied using a diversity of techniques including observations of natural history statistical descriptions of natural patterns laboratory and field experiments and mathematical modelling Community patterns arise from a complex assortment of processes including competition predation mutualism indirect effects habitat selection which result in the most complex biological entities on

earth including iconic systems such as rain forests and coral reefs This book introduces the reader to a balanced coverage of concepts and theories central to community ecology using examples drawn from terrestrial freshwater and marine systems and focusing on animal plant and microbial species The historical development of key concepts is described using descriptions of classic studies while examples of exciting new developments in recent studies are used to point toward future advances in our understanding of community organization Throughout there is an emphasis on the crucial interplay between observations experiments and mathematical models This second updated edition is a valuable resource for advanced undergraduates graduate students and established scientists who seek a broad overview of community ecology The book has developed from a course in community ecology that has been taught by the author since 1983 Figures and tables can be downloaded for free from www.wiley.com/go/morincommunityecology

Ecosystem Dynamics of the Boreal Forest : The Kluane Project Vancouver Charles J. Krebs Professor of Zoology University of British Columbia,Edmonton Stan Boutin Professor of Zoology University of Alberta,Rudy Boonstra Professor of Physiology and Zoology University of Toronto,2001-03-31 The boreal forest is one of the world s great ecosystems stretching across North America and Eurasia in an unbroken band and containing about 25% of the world s closed canopy forests The Kluane Boreal Forest Ecosystem Project was a 10 year study by nine of Canada s leading ecologists to unravel the impact of the snowshoe hare cycle on the plants and the other vertebrate species in the boreal forest In much of the boreal forest the snowshoe hare acts as a keystone herbivore fluctuating in 9 10 year cycles and dragging along secondary cycles in predators such as lynx and great horned owls By manipulating the ecosystem on a large scale from the bottom via fertilizer additions and from the top by predator exclosures they have traced the plant herbivore relationships and the predator prey relationships in this ecosystem to try to answer the question of what drives small mammal population cycles This study is unique in being large scale and experimental on a relatively simple ecosystem with the overall goal of defining what determines community structure in the boreal forest Ecosystem Dynamics of the Boreal Forest The Kluane Project summarizes these findings weaving new discoveries of the role of herbivores turned predators compensatory plant growth and predators eating predators with an ecological story rich in details and clear in its findings of a community where predation plays a key role in determining the fate of individuals and populations The study of the Kluane boreal forest raises key questions about the scale of conservation required for boreal forest communities and the many mammals and birds that live there

The Balance of Nature and Human Impact Klaus Rohde,2013-02-14 Explores equilibrium and non equilibrium in undisturbed and disturbed ecological systems examining how human activities affect the balance imbalance of nature

Community Ecology R. Putnam,1993-09-30 Chapter 1 establishes the context of such a search for pattern presenting essential definitions and exploring early work on community structure and organization The various biotic and abiotic factors which may influence communities and their dynamics are reviewed in Chapter 2 while the way in which the interrelationships between organisms

are structured within the community in food webs or in the partitioning of available resources are considered in separate chapters on food webs niche relationships and species guilds Later chapters explore the factors determining the assembly of communities species composition and pattern of relative abundance and the relative roles of deterministic and stochastic processes in determining community structure The concluding section explores the implications of observed patterns of structure and organization for stability The mathematical analyses which are an essential component of this topic are included only where essential for understanding and are presented in special box features Each mathematical section has been carefully structured and fully explained in biological terms Community Ecology presents a refreshingly readable course text for advanced undergraduates in ecology BOOK JACKET

Geographical Patterns and Local Processes in Holarctic Breeding Bird Communities Mikko Mönkkönen,1991 *The Theory of Island Biogeography Revisited* Jonathan B. Losos, Robert E. Ricklefs,2009-10-19 Robert H MacArthur and Edward O Wilson s *The Theory of Island Biogeography* first published by Princeton in 1967 is one of the most influential books on ecology and evolution to appear in the past half century By developing a general mathematical theory to explain a crucial ecological problem the regulation of species diversity in island populations the book transformed the science of biogeography and ecology as a whole In *The Theory of Island Biogeography Revisited* some of today s most prominent biologists assess the continuing impact of MacArthur and Wilson s book four decades after its publication Following an opening chapter in which Wilson reflects on island biogeography in the 1960s fifteen chapters evaluate and demonstrate how the field has extended and confirmed as well as challenged and modified MacArthur and Wilson s original ideas Providing a broad picture of the fundamental ways in which the science of island biogeography has been shaped by MacArthur and Wilson s landmark work *The Theory of Island Biogeography Revisited* also points the way toward exciting future research *Ecology Abstracts* ,1987 **Community Ecology** ,2011 **Marine Bioinvasions: Patterns, Processes and Perspectives** Judith Pederson,2012-12-06 As the global rate of marine introductions increases exotic species exert greater economic and ecological impacts affecting ecosystems and human health The complexity of marine ecosystems challenges our ability to find easy solutions to prevention management and control of introductions This book highlights issues of timely importance in marine bioinvasion science Selected topics explore the potential evolutionary consequences and ecological impacts of introduced organisms examine the feasibility of biological control and describe patterns of introduction These papers were presented at the Second International Conference on Marine Bioinvasions which featured new marine invasion research from around the world These papers should be of interest to scientists students and managers with an interest in marine bioinvasions and the application of knowledge to management concerns **Community Ecology in a Changing World** John H. Lawton,Otto Kinne,2000 **Pattern and Process in Stream Fish Community Organization** Elizabeth M. Strange,1995 **Speciation and the Recognition Concept** David M. Lambert,Hamish G. Spencer,1995 Developed by Hugh E H Paterson in the 1970s the

Recognition Concept of Species stressed the importance of the Specific Mate Recognition System SMRS and offered a view of species which was radically different from the traditional Isolation Concept Paterson held that new species were formed through incidental changes in the SMRS rather than being directly promoted In the two decades since Paterson first advanced his theory evolutionary biologists around the world have had the opportunity to use this approach in their work Speciation and the Recognition Concept is the first book to bring together a group of leading researchers to examine the relevance of Paterson s ideas today for this important topic in evolutionary biology Representing a wide variety of viewpoints the contributors explore the consequences of applying the concept to areas as diverse as the fossil record insect taxonomy the structure of mate recognition systems speciation models and the concept function in biology The Recognition Concept of species write the editors is important to biology because it represents an innovative approach to the resolution of the problem of biological diversity The concept is based upon an analysis of the logic and language of species studies Consequently it offers significant implications for ideas about the origin of species

Macroecology Kevin Gaston,Tim Blackburn,2008-04-15 Issues of scale have become increasingly important to ecologists This book addresses the structure of regional large scale ecological assemblages or communities and the influence this has at a local small scale level This macroecological perspective is essential for the broader study of ecology because the structure and function of local communities cannot be properly understood without reference to the region in which they are situated The book reviews and synthesizes the issues of current importance in macroecology providing a balanced summary of the field that will be useful for biologists at advanced undergraduate level and above These general issues are illustrated by frequent reference to specific well studied local and regional assemblages an approach that serves to relate the macroecological perspective which is perhaps often difficult to comprehend to the everyday experience of local sites Macroecology is an expanding and dynamic discipline The broad aim of the book is to promote an understanding of why it is such an important part of the wider program of research into ecology Summarises the current macroecological literature Provides numerous examples of key patterns Explicitly links local and regional scale processes Exploits detailed knowledge of one species assemblage to explore broad issues in the structuring of biodiversity
