Commutative Group Schemes Lnm 15:

Moduli of Supersingular Abelian Varieties Ke-Zheng Li, Frans Oort, 2006-11-14 Abelian varieties can be classified via their moduli. In positive characteristic the structure of the p torsion structure is an additional useful tool. For that structure supersingular abelian varieties can be considered the most special ones. They provide a starting point for the fine description of various structures. For low dimensions the moduli of supersingular abelian varieties is by now well understood. In this book we provide a description of the supersingular locus in all dimensions; in particular we compute the dimension of it; it turns out to be equal to $g(g-4)$ and we express the number of components as a class number, thus completing a long historical line where special cases were studied and general results were conjectured. Deuring, Hasse, Igusa, Oda, Oort, Katsura, Oort. **Rational Points** Gerd Faltings, Gisbert Wüstholz, 2012-12-06 This book consists of the notes from the seminar Bonn Wuppertal 1983-84 on Arithmetic Geometry. It contains a proof for the Mordell conjecture and may be useful as an introduction to Arakelov's point of view in diophantine geometry. The third edition includes an appendix in which a detailed survey on the spectacular recent developments in arithmetic algebraic geometry is given. These beautiful new results have their roots in the material covered by this book. *Enriques Surfaces I* François Cossec, Igor Dolgachev, Christian Liedtke, 2025-05-21 This book, consisting of two volumes, gives a contemporary account of the study of the class of projective algebraic surfaces known as Enriques surfaces. These surfaces were discovered more than 125 years by F. Enriques in an attempt to extend the characterization of rational algebraic curves to the case of algebraic surfaces. The novel feature of the present exposition is that no assumption on the characteristic of the ground field is assumed. This requirement calls for exploring the geometry of such surfaces by purely geometric and arithmetic methods that do not rely on transcendental methods such as the theory of periods of algebraic surfaces of type $K3$ which are close relatives of Enriques surfaces. Some of the methods use many technical tools from algebraic geometry that are discussed in Volume 1 and may be a useful source of references for the study of algebraic surfaces over fields of positive characteristic. Volume 1 also contains a detailed exposition of the theory of elliptic surfaces over fields of arbitrary characteristic. The first volume is an essential and greatly extended revision of *Enriques Surfaces I* published in 1989 by Birkhäuser and co-authored by F. Cossec and I. Dolgachev. Included is a new chapter devoted to the theory of moduli of Enriques surfaces. The two volumes together contain many examples and an extensive bibliography made up of more than 700 items. **Albanese and Picard 1-motives** Luca Barbieri-Viale, V. Srinivas, 2001 This volume gives a nice summary of current work in the theory of 1-motives. The authors present the following: Let X be an n -dimensional algebraic variety over a field of characteristic zero. They describe algebraically defined $\mathrm{Deligne} \, 1\text{-motives}$ $\mathrm{Alb} \, X$, $\mathrm{Pic} \, X$ and $\mathrm{Pic}^0 \, X$ which generalize the classical Albanese and Picard varieties of a smooth projective variety. Computed are Hodge, étale and de Rham realizations proving Deligne's conjecture for $H^{2n-1}(X, \mathbb{Q})$, $H^{2n-1}(X, \mathbb{Z})$ and $H^{2n-1}(X, \mathbb{Z})$. Investigated are functoriality, universality, homotopical invariance and invariance under formation of

projective bundles The authors compare the cohomological and homological 1 motives for normal schemes For proper schemes they obtain an Abel Jacobi map from Albanese 1 motive which is the universal regular homomorphism to semi abelian varieties By using this universal property they obtain motivic Gysin maps for projective local complete intersection morphisms The volume is suitable for advanced graduate students and researchers interested in algebraic geometry

Brauer Groups in Ring Theory and Algebraic Geometry F. van Oystaeyen, A. Verschoren, 2006-11-14 *Mémoire*, 1980 *The Publishers' Trade List Annual*, 1971 **Taming Wild Extensions: Hopf Algebras and Local Galois**

Module Theory Lindsay Childs, 2000 This book studies Hopf algebras over valuation rings of local fields and their application to the theory of wildly ramified extensions of local fields The results not previously published in book form show that Hopf algebras play a natural role in local Galois module theory Included in this work are expositions of short exact sequences of Hopf algebras Hopf Galois structures on separable field extensions a generalization of Noether's theorem on the Galois module structure of tamely ramified extensions of local fields to wild extensions acted on by Hopf algebras connections between tameness and being Galois for algebras acted on by a Hopf algebra constructions by Larson and Greither of Hopf orders over valuation rings ramification criteria of Byott and Greither for the associated order of the valuation ring of an extension of local fields to be Hopf order the Galois module structure of wildly ramified cyclic extensions of local fields of degree p and p^2 and Kummer theory of formal groups Beyond a general background in graduate level algebra some chapters assume an acquaintance with some algebraic number theory From there this exposition serves as an excellent resource and motivation for further work in the field *Mathematical Reviews*, 2000 **The Rising Sea** Ravi Vakil, 2025-10-21 An accessible motivated introduction to one of the most dynamic areas of mathematics Decades ago Mumford wrote that algebraic geometry seems to have acquired the reputation of being esoteric exclusive and very abstract with adherents who are secretly plotting to take over all the rest of mathematics The revolution has now fully come to pass and has fundamentally changed how we think about many fields of mathematics This book provides a thorough foundation in the powerful ideas that now shape the landscape with an informal yet rigorous exposition that builds intuition for understanding the formidable machinery It begins with a discussion of categorical thinking and sheaves and then develops the notion of schemes and varieties as examples of geometric spaces before discussing their specific aspects The book goes on to cover topics such as dimension and smoothness vector bundles and their natural generalizations and important cohomological tools and their applications Important optional topics are included in starred sections Provides a comprehensive introduction certain to become the standard on the subject Features a wealth of exercises that enable students to learn by doing Requires few prerequisites developing the tools students need to succeed from category theory and sheaf theory to commutative and homological algebra Uses an example driven approach that builds mathematical intuition Is a self contained textbook for graduate students and an essential reference for researchers **Journal of**
