Kister, 2000-05-05 This second volume of *Featured Reviews* makes available special detailed reviews of some of the most important mathematical articles and books published from 1997 through 1999 Also included are excellent reviews of several classic books and articles published prior to 1970 Among those reviews for example are the following Homological Algebra by Henri Cartan and Samuel Eilenberg reviewed by G Hochschild Faisceaux algébriques cohérents by Jean Pierre Serre reviewed by C Chevalley and On the Theory of General Partial Differential Operators by Lars Hormander reviewed by J L Lions In particular those seeking information on current developments outside their own area of expertise will find the volume very useful By identifying some of the best publications papers and books that have had or are expected to have a significant impact in applied and pure mathematics this volume will serve as a comprehensive guide to important new research across all fields covered by MR **Canadian Mathematical Bulletin**, 1984-12 *Mostly Finite Geometries* Norman Johnson, 1997-05-06 Based on the proceedings of the conference held at the University of Iowa in honour and celebration of the mathematician T G Ostrom's 80th birthday this text focuses on finite geometries as well as topological geometries in the infinite case some of which originate with ideas of finite geometric objects It includes information about flocks of quadratic cones and related geometric and combinatorial structures

Polygons is the first book to cover in a coherent manner the theory of polygons from scratch. In particular, it fills elementary gaps in the literature and gives an up-to-date account of current research in this area, including most proofs which are often unified and streamlined in comparison to the versions generally known. Generalized Polygons will be welcomed both by the student seeking an introduction to the subject as well as the researcher who will value the work as a reference. In particular, it will be of great value for specialists working in the field of generalized polygons, which are incidentally the rank 2 Tits buildings or in fields directly related to Tits buildings, incidence geometry, and finite geometry. The approach taken in the book is of geometric nature, but algebraic results are included and proven in a geometric way. A noteworthy feature is that the book unifies and generalizes notions, definitions, and results that exist for quadrangles, hexagons, octagons in the literature, very often considered separately for polygons. Many alternative viewpoints given in the book heighten the sense of beauty of the subject and help to provide further insight into the matter. *Note Di Matematica*, 1998 *Mathematical Reviews*, 1999

Translation Planes Norbert Knarr, 1995-09-18. The book discusses various construction principles for translation planes and spreads from a general and unifying point of view and relates them to the theory of kinematic spaces. The book is intended for people working in the field of incidence geometry and can be read by everyone who knows the basic facts about projective and affine planes. The methods developed work especially well for topological spreads of real and complex vector spaces. In particular, a complete classification of all semifield spreads of finite dimensional complex vector spaces is obtained.
