Combinatorial Search: From Algorithms to Systems Youssef Hamadi, 2013-10-29 Although they are believed to be unsolvable in general tractability results suggest that some practical NP hard problems can be efficiently solved Combinatorial search algorithms are designed to efficiently explore the usually large solution space of these instances by reducing the search space to feasible regions and using heuristics to efficiently explore these regions Various mathematical formalisms may be used to express and tackle combinatorial problems among them the constraint satisfaction problem CSP and the propositional satisfiability problem SAT These algorithms or constraint solvers apply search space reduction through inference techniques use activity based heuristics to guide exploration diversify the searches through frequent restarts and often learn from their mistakes In this book the author focuses on knowledge sharing in combinatorial search the capacity to generate and exploit meaningful information such as redundant constraints heuristic hints and performance measures during search which can dramatically improve the performance of a constraint solver Information can be shared between multiple constraint solvers simultaneously working on the same instance or information can help achieve good performance while solving a large set of related instances In the first case information sharing has to be performed at the expense of the underlying search effort since a solver has to stop its main effort to prepare and communicate the information to other solvers on the other hand not sharing information can incur a cost for the whole system with solvers potentially exploring unfeasible spaces discovered by other solvers In the second case sharing performance measures can be done with little overhead and the goal is to be able to tune a constraint solver in relation to the characteristics of a new instance this corresponds to the selection of the most suitable algorithm for solving a given instance The book is suitable for researchers practitioners and graduate students working in the areas of optimization search constraints and computational complexity

State-Space Search Weixiong Zhang, 1999-10-14 This book is particularly concerned with heuristic state space search for combinatorial optimization Its two central themes are the average case complexity of state space search algorithms and the applications of the results notably to branch and bound techniques Primarily written for researchers in computer science the author presupposes a basic familiarity with complexity theory and it is assumed that the reader is familiar with the basic concepts of random variables and recursive functions Two successful applications are presented in depth one is a set of state space transformation methods which can be used to find approximate solutions quickly and the second is forward estimation for constructing more informative evaluation functions

State Space Search Fouad Sabry, 2023-06-28 What Is State Space Search State space search is a technique that is employed in the field of computer science particularly artificial intelligence AI in which consecutive configurations or states of an instance are explored with the objective of finding a goal state with the desired feature The term state space search comes from the phrase state space which refers to the space in which the process takes place How You Will Benefit I Insights and validations about the following topics Chapter 1 State

Csiszár, Gyula O.H. Katona, Gabor Tardos, 2007-04-05 The present volume is a collection of survey papers in the fields given in the title They summarize the latest developments in their respective areas More than half of the papers belong to search theory which lies on the borderline of mathematics and computer science information theory and combinatorics respectively The volume is slightly related to the twin conferences Search And Communication Complexity and Information Theory In Mathematics held at Balatonlelle Hungary in 2000 These conferences led us to believe that there is a need for such a collection of papers The paper written by Martin Aigner starts with the following relatively new search problem Given n boolean variables as input one has to find one of them whose value is in majority The goal is to minimize the number of tests needed for this where one test is to compare two input variables for equality The paper surveys the large set of problems and results which grew out of this one In the traditional search model an unknown element is sought in a finite set based on the information that the unknown element is or is not in some asked subsets A variant is when a 0/1 function is given on the underlying set and only the values of this function at the unknown element x is sought rather than x itself This is called the recognition problem *VLSI Placement and Routing: The PI Project* Alan T. Sherman, 2012-12-06 This book provides a

superb introduction to and overview of the MIT PI System for custom VLSI placement and routing Alan Sherman has done an excellent job of collecting and clearly presenting material that was previously available only in various theses conference papers and memoranda He has provided here a balanced and comprehensive presentation of the key ideas and techniques used in PI discussing part of his own Ph.D. work primarily on the placement problem in the context of the overall design of PI and the contributions of the many other PI team members I began the PI Project in 1981 after learning first hand how difficult it is to manually place modules and route interconnections in a custom VLSI chip In 1980 Adi Shamir Leonard Adleman and I designed a custom VLSI chip for performing RSA encryption decryption 226 I became fascinated with the combinatorial and algorithmic questions arising in placement and routing and began active research in these areas The PI Project was started in the belief that many of the most interesting research issues would arise during an actual implementation effort and secondarily in the hope that a practically useful tool might result The belief was well founded but I had underestimated the difficulty of building a large easily used software tool for a complex domain the PI software should

be considered as a prototype implementation validating the design choices made
