Color Appearance Models Mark D. Fairchild, 2013-06-07 The essential resource for readers needing to understand visual perception and for those trying to produce reproduce and measure color appearance in various applications such as imaging entertainment materials design architecture and lighting This book builds upon the success of previous editions and will continue to serve the needs of those professionals working in the field to solve practical problems or looking for background for on going research projects It would also act as a good course text for senior undergraduates and postgraduates studying color science The 3rd Edition of Color Appearance Models contains numerous new and expanded sections providing an updated review of color appearance and includes many of the most widely used models to date ensuring its continued success as the comprehensive resource on color appearance models Key features Presents the fundamental concepts and phenomena of color appearance what objects look like in typical viewing situations and practical techniques to measure model and predict those appearances Includes the clear explanation of fundamental concepts that makes the implementation of mathematical models very easy to understand Explains many different types of models and offers a clear context for the models their use and future directions in the field Color Appearance Models Mark D. Fairchild, 2005-07-08 There is an ever increasing demand for a standard way to transport colours among devices on the Internet and for achieving colour fidelity across digital media The rapid growth in colour imaging technology has led to the emergence of colour management systems These systems require colour appearance models so that images produced in one medium and viewed in a particular environment may be reproduced in a second medium and viewed under different conditions The eagerly anticipated second edition of Colour Appearance Models brings the fundamental issues and current solutions in the area of colour appearance modelling together in a single place for those needing to solve practical problems or looking for background for ongoing research projects This book provides the relevant information for an updated review of colour appearance and provide details of many of the most widely used models to date for example Nayatani et al Hunt and RLAB and the ATD and LLAB appearance models that are of increasing interest for some applications It also includes the recently formulated CIECAM02 model that represents a significant improvement of CIECAM97S and is the best possible model based on current knowledge Fairchild presents an updated overview of device independent colour imaging and finally introduces the concept of image appearance modelling as a potential future direction for colour appearance modelling research A website accompanies this text that lists developments publications and calculations related to the material in this book *Comparing Color Appearance Models Using Pictorial Images* Taek Gyu Kim, 1994 Eight different color appearance models were tested using pictorial images A psychophysical paired comparison experiment was performed where 30 color normal observers judged reference and test images via successive Ganzfeld haploscopic viewing such that each eye maintained constant chromatic adaptation and inter ocular interactions were minimized It was found that models based on

von Kries had best performance specifically CIELAB HUNT RLAB and von Kries Abstract

Color-appearance Modeling for Cross-media Image Reproduction Karen M. Braun,1996 Five color appearance transforms were tested under a variety of conditions to determine which is best for producing CRT reproductions of original printed images The transforms included von Kries chromatic adaptation CIELAB color space RLAB color appearance model Hunt s color appearance model and Nayatani s color appearance model It was found that RLAB produced the best matches for changes in white point luminance level and background changes but did not accurately predict the effect of surround The ability of CIELAB color space was equal to that of RLAB in many cases and performed better for changes in surround Expert observers generated CRT images in one viewing condition that they perceived to match an original image viewed in another condition This technique produced images that were equal to or better than the best color appearance model tested and is a useful technique to generate color appearance data for developing new models and testing existing models Abstract

is vital to control the color appearance of content for many applications of AR In this research color appearance in the see through design of augmented reality environment is studied and modeled Using a bench top optical mixing apparatus as an AR simulator objective measurements of mixed colors in AR were performed to study the light behavior in AR environment Psychophysical color matching experiments were performed to understand color perception in AR These experiments were performed first for simple 2D stimuli with single color both as background and foreground and later for more visually complex stimuli to better represent real content that is presented in AR Color perception in AR environment was compared to color perception on a display which showed they are different from each other The applicability of the CAM16 color appearance model one of the most comprehensive current color appearance models in AR environment was evaluated The results showed that the CAM16 is not accurate in predicting the color appearance in AR environment In order to model color appearance in AR environment four approaches were developed using modifications in tristimulus and color appearance spaces and the best performance was found to be for Approach 2 which was based on predicting the tristimulus values of the mixed content from the background and foreground color Abstract **Image Quality and System Performance** ,2004
