Integer and Combinatorial Optimization Laurence A. Wolsey, George L. Nemhauser, 1999-07-08 Rave reviews for INTEGER AND COMBINATORIAL OPTIMIZATION This book provides an excellent introduction and survey of traditional fields of combinatorial optimization It is indeed one of the best and most complete texts on combinatorial optimization available And with more than 700 entries it has quite an exhaustive reference list Optima A unifying approach to optimization problems is to formulate them like linear programming problems while restricting some or all of the variables to the integers This book is an encyclopedic resource for such formulations as well as for understanding the structure of and solving the resulting integer programming problems Computing Reviews This book can serve as a basis for various graduate courses on discrete optimization as well as a reference book for researchers and practitioners Mathematical Reviews This comprehensive and wide ranging book will undoubtedly become a standard reference book for all those in the field of combinatorial optimization Bulletin of the London Mathematical Society This text should be required reading for anybody who intends to do research in this area or even just to keep abreast of developments Times Higher Education Supplement London Also of interest INTEGER PROGRAMMING Laurence A Wolsey Comprehensive and self

contained this intermediate level guide to integer programming provides readers with clear up to date explanations on why some problems are difficult to solve how techniques can be reformulated to give better results and how mixed integer programming systems can be used more effectively 1998 0 471 28366 5 260 pp **Combinatorial Optimization** Mustafa Akgül,Horst W. Hamacher,Süleyman Tüfekci,2012-12-06 There have been significant developments in the theory and practice of combinatorial optimization in the last 15 years This progress has been evidenced by a continuously increasing number of international and local conferences books and papers in this area This book is also another contribution to this burgeoning area of operations research and optimization This volume contains the contributions of the participants of the recent NATO Advanced Study Institute New Frontiers in the Theory and Practice of Combinatorial Optimization which was held at the campus of Bilkent University in Ankara Turkey July 16 29 1990 In this conference we brought many prominent researchers and young and promising scientists together to discuss current and future trends in the theory and practice of combinatorial optimization The Bilkent campus was an excellent environment for such an undertaking Being outside of Ankara the capital of Turkey Bilkent University gave the participants a great opportunity for exchanging ideas and discussing new theories and applications without much distraction One of the primary goals of NATO ASIs is to bring together a group of scientists and research scientists primarily from the NATO countries for the dissemination of advanced scientific knowledge and the promotion of international contacts among scientists We believe that we accomplished this mission very successfully by bringing together 15 prominent lecturers and 45 promising young scientists from 12 countries in a university environment for 14 days of intense lectures presentations and discussions *Concepts of Combinatorial Optimization* Vangelis Th. convex body is based on the oracle model of convex bodies and uses the ellipsoid method as a preprocessing technique. The polynomial time equivalence of optimization, separation, and membership has become a commonly employed tool in the study of the complexity of combinatorial optimization problems and in the newly developing field of computational convexity. Implementations of the basis reduction algorithm can be found in various computer algebra software systems. On the other hand, several of the open problems discussed in the first edition are still unsolved. For example, there are still no combinatorial polynomial time algorithms known for minimizing a submodular function or finding a maximum clique in a perfect graph. Moreover, despite the success of the interior point methods for the solution of explicitly given linear programs, there is still no method known that solves implicitly given linear programs such as those described in this book and that is both practically and theoretically efficient. In particular, it is not known how to adapt interior point methods to such linear programs.

Complexity and Approximation Giorgio Ausiello, Pierluigi Crescenzi, Giorgio Gambosi, Viggo Kann, Alberto Marchetti-Spaccamela, Marco Protasi, 2012-12-06 N COMPUTER applications we are used to live with approximation Various notions of approximation appear in fact in many circumstances One notable example is the type of approximation that arises in numerical analysis or in computational geometry from the fact that we cannot perform computations with arbitrary precision and we have to truncate the representation of real numbers In other cases we use to approximate complex mathematical objects by simpler ones for example we sometimes represent non linear functions by means of piecewise linear ones The need to solve difficult optimization problems is another reason that forces us to deal with approximation In particular when a problem is computationally hard i.e. the only way we know to solve it is by making use of an algorithm that runs in exponential time it may be practically unfeasible to try to compute the exact solution because it might require months or years of machine time even with the help of powerful parallel computers In such cases we may decide to restrict ourselves to compute a solution that though not being an optimal one nevertheless is close to the optimum and may be determined in polynomial time We call this type of solution an approximate solution and the corresponding algorithm a polynomial time approximation algorithm Most combinatorial optimization problems of great practical relevance are indeed computationally intractable in the above sense In formal terms they are classified as NP hard optimization problems
