## **Compilers And Operating Systems For Low Power:**

**Compilers and Operating Systems for Low Power** Luca Benini, Mahmut Kandemir, J. Ramanujam, 2011-06-28

Compilers and Operating Systems for Low Power focuses on both application level compiler directed energy optimization and low power operating systems. Chapters have been written exclusively for this volume by several of the leading researchers and application developers active in the field. The first six chapters focus on low energy operating systems or more in general energy aware middleware services. The next five chapters are centered on compilation and code optimization. Finally the last chapter takes a more general viewpoint on mobile computing. The material demonstrates the state of the art work and proves that to obtain the best energy performance characteristics compilers, system software and architecture must work together. The relationship between energy aware middleware and wireless microsystems, mobile computing and other wireless applications are covered. This work will be of interest to researchers in the areas of low power computing, embedded systems, compiler optimizations and operating systems.

**Power-Aware Computer Systems** Babak Falsafi, 2004-12-17. Welcome to the proceedings of the 3rd Power Aware Computer Systems PACS 2003 Workshop held in conjunction with the 36th Annual International Symposium on Microarchitecture MICRO 36. The increase in power and energy dissipation in computer systems has begun to limit performance and has also resulted in higher cost and lower reliability. The increase also implies reduced battery life in portable systems. Because of the magnitude of the problem, all levels of computer systems including circuits, architectures and software are being employed to address power and energy issues. PACS 2003 was the third workshop in its series to explore power and energy awareness at all levels of computer systems and brought together experts from academia and industry. These proceedings include 14 research papers selected from 43 submissions.

spanning a wide spectrum of areas in power aware systems. We have grouped the papers into the following categories: 1. compilers, 2. embedded systems, 3. microarchitectures and 4. cache and memory systems. The first paper on compiler techniques proposes pointer reuse analysis that is biased by runtime information, i.e. the targets of pointers are determined based on the likelihood of their occurrence at runtime to map accesses to more efficient memory access paths, e.g. avoid tag match. Another paper proposes compiling multiple programs together so that disk accesses across the programs can be synchronized to achieve longer sleep times in disks than if the programs are optimized separately.

**Power-efficient System Design** Preeti Ranjan Panda, B. V. N. Silpa, Aviral Shrivastava, Krishnaiah Gummidipudi, 2010-07-23. The Information and communication technology (ICT) industry is said to account for 2% of the worldwide carbon emissions, a fraction that continues to grow with the relentless push for more and more sophisticated computing equipment, communications infrastructure and mobile devices. While computers evolved in the direction of higher and higher performance for most of the latter half of the 20th century, the late 1990s and early 2000s saw a new emerging fundamental concern that has begun to shape our day to day thinking in system design: power dissipation. As we elaborate in Chapter 1, a variety of factors colluded to raise power efficiency as a first class design concern in

the designer's mind with profound consequences all over the old semiconductor process design circuit design design automation tools system and application software all the way to large data centers Power efficient System Design originated from a desire to capture and highlight the exciting developments in the rapidly evolving field of power and energy optimization in electronic and computer based systems Tremendous progress has been made in the last two decades and the topic continues to be a fascinating research area To develop a clearer focus we have concentrated on the relatively higher level of design abstraction that is loosely called the system level In addition to the extensive coverage of traditional power reduction targets such as CPU and memory the book is distinguished by detailed coverage of relatively modern power optimization ideas focussing on components such as compilers operating systems servers data centers and graphics processors
