## **Degree Theory In Analysis And Applications:**

**Degree Theory in Analysis and Applications** Irene Fonseca, Wilfrid Gangbo, 1995 In this book we study the degree theory and some of its applications in analysis It focuses on the recent developments of this theory for Sobolev functions which distinguishes this book from the currently available literature We begin with a thorough study of topological degree for continuous functions The contents of the book include degree theory for continuous functions the multiplication theorem Hopf's theorem Brouwer's fixed point theorem odd mappings Jordan's separation theorem Following a brief review of measure theory and Sobolev functions and study local invertibility of Sobolev functions These results are put to use in the study variational principles in nonlinear elasticity The Leray Schauder degree in infinite dimensional spaces is exploited to obtain fixed point theorems We end the book by illustrating several applications of the degree in the theories of ordinary differential equations and partial differential equations

*Topics in Nonlinear Functional Analysis* L. Nirenberg, 1974 Since its first appearance as a set of lecture notes published by the Courant Institute in 1974 this book served as an introduction to various subjects in nonlinear functional analysis The current edition is a reprint of these notes with added bibliographic references Topological and analytic methods are developed for treating nonlinear ordinary and partial differential equations The first two chapters of the book introduce the notion of topological degree and develop its basic properties These properties are used in later chapters in the discussion of bifurcation theory the possible branching of solutions as parameters vary including the proof of Rabinowitz global bifurcation theorem Stability of the branches is also studied The book concludes with a presentation of some generalized implicit function theorems of Nash Moser type with applications to Kolmogorov Arnold Moser theory and to conjugacy problems For more than 20 years this book continues to be an excellent graduate level textbook and a useful supplementary course text Titles in this series are copublished with the Courant Institute of Mathematical Sciences at New York University

**Handbook of Topological Fixed Point Theory** Robert F. Brown, Massimo Furi, L. Gorniewicz, Boju Jiang, 2005-12-05 This book is the first in the world literature presenting all new trends in topological fixed point theory Until now all books connected to the topological fixed point theory were devoted only to some parts of this theory This book will be especially useful for post graduate students and researchers interested in the fixed point theory particularly in topological methods in nonlinear analysis differential equations and dynamical systems The content is also likely to stimulate the interest of mathematical economists population dynamics experts as well as theoretical physicists exploring the topological dynamics

 and Applications** Yeol Je Cho, Yu-Qing Chen, 2006-03-27 Since the 1960s many researchers have extended topological  
 degree theory to various non compact type nonlinear mappings and it has become a valuable tool in nonlinear analysis  
 Presenting a survey of advances made in generalizations of degree theory during the past decade this book focuses on  
 topological degree theory in normed spaces and its applications The authors begin by introducing the Brouwer degree theory  
 in  $\mathbb{R}^n$  then consider the Leray Schauder degree for compact mappings in normed spaces Next they explore the degree theory  
 for condensing mappings including applications to ODEs in Banach spaces This is followed by a study of degree theory for A  
 proper mappings and its applications to semilinear operator equations with Fredholm mappings and periodic boundary value  
 problems The focus then turns to construction of Mawhin s coincidence degree for L compact mappings followed by a  
 presentation of a degree theory for mappings of class S and its perturbations with other monotone type mappings The final  
 chapter studies the fixed point index theory in a cone of a Banach space and presents a notable new fixed point index for  
 countably condensing maps Examples and exercises complement each chapter With its blend of old and new techniques

Topological Degree Theory and Applications forms an outstanding text for self study or special topics courses and a valuable reference for anyone working in differential equations analysis or topology

*An Introduction to Nonlinear Analysis and Fixed Point Theory* Hemant Kumar Pathak, 2018-05-19 This book systematically introduces the theory of nonlinear analysis providing an overview of topics such as geometry of Banach spaces differential calculus in Banach spaces monotone operators and fixed point theorems It also discusses degree theory nonlinear matrix equations control theory differential and integral equations and inclusions The book presents surjectivity theorems variational inequalities stochastic game theory and mathematical biology along with a large number of applications of these theories in various other disciplines Nonlinear analysis is characterised by its applications in numerous interdisciplinary fields ranging from engineering to space science hydromechanics to astrophysics chemistry to biology theoretical mechanics to biomechanics and economics to stochastic game theory Organised into ten chapters the book shows the elegance of the subject and its deep rooted concepts and techniques which provide the tools for developing more realistic and accurate models for a variety of phenomena encountered in diverse applied fields It is intended for graduate and undergraduate students of mathematics and engineering who are familiar with discrete mathematical structures differential and integral equations operator theory measure theory Banach and Hilbert spaces locally convex topological vector spaces and linear functional analysis

*Nonlinear Analysis and Variational Problems* Panos M. Pardalos, Themistocles M. Rassias, Akhtar A. Khan, 2009-10-20 The chapters in this volume written by international experts from different fields of mathematics are devoted to honoring George Isac a renowned mathematician These contributions focus on recent developments in complementarity theory variational principles stability theory of functional equations nonsmooth optimization and several other important topics at the forefront of nonlinear analysis and optimization

Nonlinear Analysis - Theory and Methods Nikolaos S. Papageorgiou, Vicențiu D. Rădulescu, Dušan D. Repovš, 2019-02-26 This book emphasizes those basic abstract methods and theories that are useful in the study of nonlinear boundary value problems The content is developed over six chapters providing a thorough introduction to the techniques used in the variational and topological analysis of nonlinear boundary value problems described by stationary differential operators The authors give a systematic treatment of the basic mathematical theory and constructive methods for these classes of nonlinear equations as well as their applications to various processes arising in the applied sciences They show how these diverse topics are connected to other important parts of mathematics including topology functional analysis mathematical physics and potential theory Throughout the book a nice balance is maintained between rigorous mathematics and physical applications The primary readership includes graduate students and researchers in pure and applied nonlinear analysis

Equivariant Degree Theory Jorge Ize, Alfonso Vignoli, 2008-08-22 This book presents a new degree theory for maps which commute with a group of symmetries This degree is no longer a single integer but an element of the group of equivariant homotopy classes of maps between two spheres and depends on the orbit types of the spaces The

authors develop completely the theory and applications of this degree in a self contained presentation starting with only elementary facts The first chapter explains the basic tools of representation theory homotopy theory and differential equations needed in the text Then the degree is defined and its main abstract properties are derived The next part is devoted to the study of equivariant homotopy groups of spheres and to the classification of equivariant maps in the case of abelian actions These groups are explicitly computed and the effects of symmetry breaking products and composition are thoroughly studied The last part deals with computations of the equivariant index of an isolated orbit and of an isolated loop of stationary points Here differential equations in a variety of situations are considered symmetry breaking forcing period doubling twisted orbits first integrals gradients etc Periodic solutions of Hamiltonian systems in particular spring pendulum systems are studied as well as Hopf bifurcation for all these situations
