Demilitarisation Of Munitions Reuse And Recycling Concepts For Conventional Munitions And Rocket Propellants:

Demilitarisation of Munitions Victor G. Bar'yakhtar, T. Rosendorfer, 2012-12-06 Hitherto the disposal of munitions was mostly concerned with obsolete stocks but the political developments in the states of the former Soviet Union have necessitated the disposal of vast quantities of current and obsolete stocks Obviously open burning open detonation cannot be used on such a large scale not least for environmental considerations There are two main technical problems associated with the disposal of munitions on the scale required First the materials are not simple wastes or rubbish Their handling storage packaging and transportation are subject to very rigid regulation and justifiably so for obvious reasons Second they are very valuable goods for which a high price has been paid by the holding states economic systems Mere destruction would mean the irretrievable loss of the value invested But therein lies the problem Goods like steel or brass scrap can easily be reclaimed but hypergols and other rocket fuels for instance represent a true chemical challenge while under certain conditions explosives may be diverted to civilian use This in summary is the problem that the present book deals with the two pronged attack involving demilitarization and recycling technologies

Dismantlement and Destruction of Chemical, Nuclear and Conventional Weapons N. Schulte, 2013-04-17 The end of the Cold War opened unprecedented opportunities for reductions in weapons of mass destruction With these opportunities came new challenges both scientific and political Traditionally approached by different groups the scientific technical and political challenges are inextricably intertwined Agreements to dismantle and destroy chemical nuclear and conventional weapons after having been negotiated via diplomatic channels require the expertise of scientists associated with their development to determine the safest and most environmentally sound methods of destruction It is in this context that representatives from sixteen countries and five international organizations were convened jointly by NATO the Ministry of Foreign Affairs of the Federal Republic of Germany and the State Government of North Rhine Westphalia 19 21 May 1996 in a meeting near Bonn to take stock of worldwide efforts to destroy and dismantle chemical nuclear and conventional weapons remaining after the end of the Cold War NATO support was provided under the auspices of the NATO Science Committee's Panel on Disarmament Technologies The conference brought together the major actors involved in the dismantlement and destruction of chemical nuclear and conventional weapons highlighted the substantial accomplishments achieved in this area and pinpointed the remaining technical obstacles still to be overcome It also underlined the critical importance of transparency data exchange and verification as indispensable preconditions for disarmament and cooperative security

The U S military has a stockpile of approximately 400 000 tons of excess obsolete or unserviceable munitions About 60 000 tons are added to the stockpile each year Munitions include projectiles bombs rockets landmines and missiles Open burning open detonation OB OD of these munitions has been a common disposal practice for decades although it has decreased significantly since 2011 OB OD is relatively quick procedurally straightforward and inexpensive However the downside of OB and OD is that they release contaminants from the operation directly into the environment Over time a number of technology alternatives to OB OD have become available and more are in research and development Alternative technologies generally involve some type of contained destruction of the energetic materials including contained burning or contained detonation as well as contained methods that forego combustion or detonation Alternatives for the Demilitarization of Conventional Munitions reviews the current conventional munitions demilitarization stockpile and analyzes existing and emerging disposal treatment and reuse technologies This report identifies and evaluates any barriers to full scale deployment of alternatives to OB OD or non closed loop incineration combustion and provides recommendations to overcome such barriers

Defense Industries Pelagio Castelo Branco, Hiltmar Schubert, Jose Campos, 2007-10-13 The state of the art in

the area of security related civil science and technology concerning energetic materials and munitions is of pressing importance at the present time because 10 years after the end of the cold war in many countries in east and west huge stockpiles of munitions still await destruction The safety behavior of munitions and their energetic material is the determining factor for all precautionary measures for the protection of environment and population The probability of a catastrophic reaction of munitions and their energetic components will be so more likely the closer the munitions are to the end of their life time Residues and undetected ordnance recycling destruction of ammunition and depletion or reuse of energetic materials will either cause more or less damage to environment Scientific research and development have the aim to increase performance of munitions on one side and to improve safety in relation to unpredictable events on the other side The impact on the environment by the production and normal use of munitions and their residues after use will acquire an increasing importance in environmental awareness The excellent technical presentations were classified in five Groups according to the technical programme The Introduction to the subject Methods tests and application Insensitive and green munitions Storage and transportation and Demilitarisation and recycling sessions were closed by a final and general interesting discussion among participants **State-of-the-art Study** Norman I.
