Definition Of Programming Language

A programming language is basically a computer language that a computer understands quickly. Programmers use this programming language to invent various software programs, scripts, and various types of instructions for the machine to execute the program.

Programming language is a formal language containing a set of strings by which we process the machine code output. It is a kind of computer language and is employed in computer programming to implement algorithms.

Although several languages share similarities, each programming language has its functions and features for different purposes. They have to write the source code, syntax, structures which is the main part of the program. Then, the programmer often compiles the code into machine language that the computer can understand.

system produce efficient programs This text then discusses how to use parentheses to help the system identify identical subexpressions within an expression and thereby eliminate their duplicate calculation Other chapters consider FORTRAN programming techniques needed to produce optimum object programs This book discusses as well the developments leading to ALGOL 60 The final chapter presents the biography of Adin D Falkoff This book is a valuable resource for graduate students practitioners historians statisticians mathematicians programmers as well as computer scientists and specialists
