Discretization Of Homoclinic Orbits Rapid Forcing And Invisible Chaos:

Discretization of Homoclinic Orbits, Rapid Forcing and "Invisible" Chaos Bernold Fiedler, Jürgen Scheurle, 1996

Numerically speaking continuous time dynamical systems do not exist Rather a discretized version is studied and interpreted in analogy to the continuous time dynamical system Over fixed finite time intervals this analogy is quite close and well understood in terms of discretization errors and sophisticated discretization schemes Over large or infinite time intervals this analogy is not so clear because discretization errors tend to accumulate exponentially with time In this paper we specifically investigate the correspondence between continuous and discrete time dynamical systems for homoclinic orbits By definition these are orbits which tend to the same stationary point for both large positive and large negative times Analysis, Modeling and Simulation of Multiscale Problems Alexander Mielke, 2006-10-14 This book reports recent mathematical developments in the Programme Analysis Modeling and Simulation of Multiscale Problems which started as a German research initiative in 2006 Multiscale problems occur in many fields of science such as microstructures in materials sharp interface models many particle systems and motions on different spatial and temporal scales in quantum mechanics or in molecular dynamics The book presents current mathematical foundations of modeling and proposes efficient numerical treatment *Localization and Solitary Waves in Solid Mechanics* A. R. Champneys, G. W. Hunt, J. M. T. Thompson, 1999 This book is a collection of recent reprints and new material on fundamentally nonlinear problems in structural systems which demonstrate localized responses to continuous inputs It has two intended audiences For mathematicians and physicists it should provide useful new insights into a classical yet rapidly developing area of application of the rich subject of dynamical systems theory For workers in structural and solid mechanics it introduces a new methodology for dealing with structural localization and the related topic of the generation of solitary waves Applications range from classical problems such as the buckling of cylindrical shells twisted rods and pipelines to the folding of geological strata the failure of sandwich structures and the propagation of solitary waves in suspended beam systems *Hamiltonian Systems with Three or More Degrees of Freedom* Carles Simó, 2012-12-06 A survey of current knowledge about Hamiltonian systems with three or more degrees of freedom and related topics The Hamiltonian systems appearing in most of the applications are non integrable Hence methods to prove non integrability results are presented and the different meaning attributed to non integrability are discussed For systems near an integrable one it can be shown that under suitable conditions some parts of the integrable structure most of the invariant tori survive Many of the papers discuss near integrable systems From a topological point of view some singularities must appear in different problems either caustics geodesics moving wavefronts etc This is also related to singularities in the projections of invariant objects and can be used as a signature of these objects Hyperbolic dynamics appear as a source on unpredictable behaviour and several mechanisms of hyperbolicity are presented The destruction of tori leads to Aubrey Mather objects and this is touched on for a related class of systems Examples without periodic orbits are

constructed against a classical conjecture Other topics concern higher dimensional systems either finite networks and localised vibrations on them or infinite like the quasiperiodic Schrödinger operator or nonlinear hyperbolic PDE displaying quasiperiodic solutions Most of the applications presented concern celestial mechanics problems like the asteroid problem the design of spacecraft orbits and methods to compute periodic solutions

Dynamical Systems and Numerical Analysis A. M. Stuart, A. R. Humphries, 1998-11-28 The first three chapters contain the elements of the theory of dynamical systems and the numerical solution of initial value problems In the remaining chapters numerical methods are formulated as dynamical systems and the convergence and stability properties of the methods are examined

Difference Equations and Discrete Dynamical Systems with Applications Martin Bohner, Stefan Siegmund, Roman Šimon Hilscher, Petr Stehlík, 2020-02-10 This book presents the proceedings of the 24th International Conference on Difference Equations and Applications which was held at the Technical University in Dresden Germany in May 2018 under the auspices of the International Society of Difference Equations ISDE The conference brought together leading researchers working in the respective fields to discuss the latest developments and to promote international cooperation on the theory and applications of difference equations This book appeals to researchers and scientists working in the fields of difference equations and discrete dynamical systems and their applications

Hamiltonian Dynamical Systems H.S. Dumas, K.R. Meyer, D.S. Schmidt, 2012-12-06 From its origins nearly two centuries ago Hamiltonian dynamics has grown to embrace the physics of nearly all systems that evolve without dissipation as well as a number of branches of mathematics some of which were literally created along the way This volume contains the proceedings of the International Conference on Hamiltonian Dynamical Systems its contents reflect the wide scope and increasing influence of Hamiltonian methods with contributions from a whole spectrum of researchers in mathematics and physics from more than half a dozen countries as well as several researchers in the history of science With the inclusion of several historical articles this volume is not only a slice of state of the art methodology in Hamiltonian dynamics but also a slice of the bigger picture in which that methodology is imbedded

Handbook of Dynamical Systems B. Fiedler, 2002-02-21 This handbook is volume II in a series collecting mathematical state of the art surveys in the field of dynamical systems Much of this field has developed from interactions with other areas of science and this volume shows how concepts of dynamical systems further the understanding of mathematical issues that arise in applications Although modeling issues are addressed the central theme is the mathematically rigorous investigation of the resulting differential equations and their dynamic behavior However the authors and editors have made an effort to ensure readability on a non technical level for mathematicians from other fields and for other scientists and engineers The eighteen surveys collected here do not aspire to encyclopedic completeness but present selected paradigms The surveys are grouped into those emphasizing finite dimensional methods numerics topological methods and partial differential equations Application areas include the dynamics of neural networks fluid flows nonlinear optics and many others While the survey articles can be

read independently they deeply share recurrent themes from dynamical systems Attractors bifurcations center manifolds
 dimension reduction ergodicity homoclinicity hyperbolicity invariant and inertial manifolds normal forms recurrence shift
 dynamics stability to name just a few are ubiquitous dynamical concepts throughout the articles Discrete and Continuous
