Disease Progression and Carcinogenesis in the Gastrointestinal Tract P.R. Galle,G. Gerken,W.E. Schmidt,B. Wiedenmann,2003-09-30 Development and progression of gastrointestinal disease involves inflammatory vascular fibrogenetic and immune reactions accompanied by deregulation of cellular growth and death often resulting in cancer of the organs affected This book the proceedings of Falk Symposium 132 on Disease Progression and Carcinogenesis in the Gastrointestinal Tract held in Freiburg Germany October 9 10 2002 addresses these various cellular processes in five sections in order to build up a broad pathogenic concept of gastrointestinal disease purposely going beyond organ specific research Each section combines experts in the various fields of molecular medicine together with clinical scientists in order to stimulate interdisciplinary discussion In addition clinical chapters focus on new findings in both diagnostics and therapeutics

Immunology of the GI Tract Luis Rodrigo,2022-12-21 The intestine is the largest digestive organ in the human body and one of the largest organs in contact with the outside world In addition to digesting food to facilitate the absorption of nutrients it has a variety of other functions including the transmission of information and regulation of the metabolism Due to its unique structure the intestine is constantly exposed to various antigens and microbes To protect the body from pathogens while also maintaining a stable environment the human intestinal tract has evolved unique regional immune characteristics maintained by the mature intestinal mucosal immune system This intricate system involves intestinal epithelial cells and intestinal lymphoid tissue composed of Peyer s patches isolated lymphoid follicles mesenteric lymph nodes and so on The congenital and adaptive immune mechanisms created by the unique structure function and microenvironment of the intestine differ from those of the central and peripheral immune organs forming the regional immunity of the intestine Intestinal flora also plays an important role in maintaining intestinal homeostasis altering the structure and function of the immune system reshaping the immune microenvironment and promoting interference with the development of specific diseases In fact the immune function of the intestinal region directly affects the development of many intestine specific diseases However the integrity of this function depends on the expression of congenital genes and the regulation of the neuroendocrine system The microenvironment created by intestinal flora and its products also affects the immunity of the intestinal region In early life appropriate intestinal colonization by specific microflora stimulates the maturation of the intestinal mucosa associated lymphoid tissue If the appropriate intestinal flora fails to form during this life stage the function of the intestinal immune system becomes impaired leading to increased incidence and or morbidity of certain intestinal diseases including ulcerative colitis Crohn s disease and others
