Expert Oracle Database Architecture: 9i & 10g Programming Techiques & Solutions Thomas Kyte,2006-03-27 This is a defining book on the Oracle database for any developer or DBA who works with Oracle driven database applications Tom has a simple philosophy you can treat Oracle as a black box and just stick data into it or you can understand how it works and exploit it as a powerful computing environment If you choose the latter then you will find that there are few

information management problems that you cannot solve quickly and elegantly In summary this book provides a one stop resource containing deep wisdom on the design development and administration of Oracle applications written by one of the world s foremost Oracle experts Thomas Kyte Database Cloud Storage Nitin Vengurlekar,Prasad Bagal,2013-07-06 Implement a Centralized Cloud Storage Infrastructure with Oracle Automatic Storage Management Build and manage a scalable highly available cloud storage solution Filled with detailed examples and best practices this Oracle Press guide explains how to set up a complete cloud based storage system using Oracle Automatic Storage Management Find out how to prepare hardware build disk groups efficiently allocate storage space and handle security Database Cloud Storage The Essential Guide to Oracle Automatic Storage Management shows how to monitor your system maximize throughput and ensure consistency across servers and clusters Set up and configure Oracle Automatic Storage Management Discover and manage disks and establish disk groups Create clone and administer Oracle databases Consolidate resources with Oracle Private Database Cloud Control access encrypt files and assign user privileges Integrate replication file tagging and automatic failover Employ pre engineered private cloud database consolidation tools Check for data consistency and resync failed disks Code examples in the book are available for download **Database Architecture Design - Memory to Storage using DB2** Lawrence Dunn,2016-04-14 It continues to amaze me on the number of corporations running data based applications on DB2 who view it as a black box that simply houses their application data This disconnect with the importance of properly designed and more importantly configured data bases leads to application error lowered customer satisfaction drastically decreased potential being proactive with KPI s and increased hardware and support costs This disconnect is so prevalent that many organizations assume that the solution to a badly performing database is adding a score of new indexes buying more memory or worse going through a massive conversion upgrade effort with a new product Capital expenditure on additional memory and storage for a database that simply needs to be properly configured for its workload is something that I see various companies do every year and it s a massive waste of shareholder equity In a previous life I was responsible for capacity planning with Procter Gamble s technical infrastructure Following the Pareto Principle i e 80 20 rule the first thing that I did was identify which portion of the infrastructure was responsible for the highest costs in support licensing and new expenditures Three IBM 3090 mainframes jumped out with the highest costs so I initially placed my focus there Looking at daily workloads of each environment what became apparent was that the utilization between each machine ran a little over 40% This was a massive waste of resources So I simply rebalanced the workload dividing processing between two machines and eliminating the third This simple act of effectively spreading workload utilization saved P G 2M year The workload within a DB2 database can also be effectively spread with an effective buffer pool and storage strategy This will drastically improve overall performance eliminating the need to acquire additional memory and lowering support costs I ve been in numerous pre sales situations where a client will sign a contract to purchase a data based application and as the ink is drying they will

then ask architecture questions that they should have addressed beforehand What type of DB2 license should we buy How much memory will we need How much storage What kind of storage How many LUNs will we need to configure How many CPU s will we need These are all very relevant questions that should be addressed before making the decision to purchase a shiny new data based application However in my experience the key after the fact question that is rarely asked is What type of performance should I expect In my experience performance is seldom discussed during project startup but it is always brought up once the application is in production The issue as I stated earlier is that many technical professionals view DB2 as a black box in that they are only concerned with space With this fixated view they look at the potential size of the database to figure out how much storage to purchase Then the storage size is used to guestimate the amount of memory and CPU that should be required The assumption is made that adequately estimating hardware based on database size will also equate into having adequate performance This is a woefully inadequate assumption that will lead to subpar performance in your production environment This white paper will illustrate via a case study the benefits of completing a database architecture design as one of the first project deliverables that contains the database configuration parameters bufferpool design tablespace design LUN design and device file design This will ensure optimal database performance and low capital expenditures for your project *The Database Experts' Guide to SQL* Frank Lusardi,1988
