Convergence Theory Of Feasible Direction Methods:

Convergence Theory of Feasible Direction Methods Dingzhu Du,1991   *Mathematical Theory of Optimization* Ding-Zhu Du,Panos M. Pardalos,Weili Wu,2013-03-14 Optimization is of central importance in all sciences Nature inherently seeks optimal solutions For example light travels through the shortest path and the folded state of a protein corresponds to the structure with the minimum potential energy In combinatorial optimization there are numerous computationally hard problems arising in real world applications such as floorplanning in VLSI designs and Steiner trees in communication networks For these problems the exact optimal solution is not currently real time computable One usually computes an approximate solution with various kinds of heuristics Recently many approaches have been developed that link the discrete space of combinatorial optimization to the continuous space of nonlinear optimization through geometric analytic and algebraic techniques Many researchers have found that such approaches lead to very fast and efficient heuristics for solving large problems Although almost all such heuristics work well in practice there is no solid theoretical analysis except Karmakar s algorithm for linear programming With this situation in mind we decided to teach a seminar on nonlinear optimization with emphasis on its mathematical foundations This book is the result of that seminar During the last decades many textbooks and monographs in nonlinear optimization have been published Why should we write this new one What is the difference of this book from the others The motivation for writing this book originated from our efforts to select a textbook for a graduate seminar with focus on the mathematical foundations of optimization   **Progress in Optimization** Xiaoqi Yang,2000-04-30 This is the second in a series of contributed refereed volumes devoted to research in optimization by Australian researchers and their collaborators These volumes are intended to have wide scope and include survey papers by established researchers providing up to date information on research directions This volume includes survey and research papers on theories and methods of nonlinear programming nonconvex and discrete optimization stochastic linear programming generalized convexity complementarity and vector variational inequality problems dynamic systems and optimal control and applications to traffic assignment models train control manufacturing systems and substrate diffusion of cutaneous tissue Audience Practitioners postgraduate students and researchers in optimization   Optimization Methods and Applications Xiao-qi Yang,Kok Lay Teo,Lou Caccetta,2013-03-14 This edited book is dedicated to Professor N U Ahmed a leading scholar and a renowned researcher in optimal control and optimization on the occasion of his retirement from the Department of Electrical Engineering at University of Ottawa in 1999 The contributions of this volume are in the areas of optimal control non linear optimization and optimization applications They are mainly the im proved and expanded versions of the papers selected from those presented in two special sessions of two international conferences The first special session is Optimization Methods which was organized by K L Teo and X Q Yang for the International Conference on Optimization and Variational Inequality the City University of Hong Kong Hong Kong 1998 The other one is Optimal Control which was

organized byK Teo and L Caccetta for the Dynamic Control Congress Ottawa 1999 This volume is divided into three parts Optimal Control Optimization Methods and Applications The Optimal Control part is concerned with com putational methods modeling and nonlinear systems Three computational methods for solving optimal control problems are presented i a regularization method for computing ill conditioned optimal control problems ii penalty function methods that appropriately handle final state equality constraints and iii a multilevel optimization approach for the numerical solution of opti mal control problems In the fourth paper the worst case optimal regulation involving linear time varying systems is formulated as a minimax optimal con trol problem   Notices of the American Mathematical Society American Mathematical Society,1992

Nonlinear Optimization H. A. Eiselt,Carl-Louis Sandblom,2019-11-09 This book provides a comprehensive introduction to nonlinear programming featuring a broad range of applications and solution methods in the field of continuous optimization It begins with a summary of classical results on unconstrained optimization followed by a wealth of applications from a diverse mix of fields e g location analysis traffic planning and water quality management to name but a few In turn the book presents a formal description of optimality conditions followed by an in depth discussion of the main solution techniques Each method is formally described and then fully solved using a numerical example   Practical Bilevel Optimization Jonathan F. Bard,1998-12-31 The focus of this book is on bilevel programming which combines elements of hierarchical optimization and game theory The basic model addresses the problem where two decision makers each with their individual objectives act and react in a noncooperative manner The actions of one affect the choices and payoffs available to the other but neither player can completely dominate the other in the traditional sense Over the last 20 years there has been a steady growth in research related to theory and solution methodologies for bilevel programming This interest stems from the inherent complexity and consequent challenge of the underlying mathematics as well as the applicability of the bilevel model to many real world situations The primary aim of this book is to provide a historical perspective on algorithmic development and to highlight those implementations that have proved to be the most efficient in their class A corollary aim is to provide a sampling of applications in order to demonstrate the versatility of the basic model and the limitations of current technology What is unique about this book is its comprehensive and integrated treatment of theory algorithms and implementation issues It is the first text that offers researchers and practitioners an elementary understanding of how to solve bilevel programs and a perspective on what success has been achieved in the field Audience Includes management scientists operations researchers industrial engineers mathematicians and economists   *Reviews in Numerical Analysis, 1980-86* ,1987 These five volumes bring together a wealth of bibliographic information in the area of numerical analysis Containing over 17 600 reviews of articles books and conference proceedings these volumes represent all the numerical analysis entries that appeared in Mathematical Reviews between 1980 and 1986 Author and key indexes appear at the end of volume 5   Advances in Optimization and Parallel Computing Panos M. Pardalos,1992 Optimization and parallel computing are areas

of research characterized by an extremely rapid development during the last three decades The main purpose of this volume is to show the reader a variety of optimization methods and related aspects of parallel computing techniques The diversity of topics discussed in the book cover a broad spectrum of recent developments in these areas This book which grew out of many contributions given by distinguished researchers in honour of the 70th birthday of J B Rosen one of the pioneers in optimization is intended to serve as a guide for recent literature and as a stimulant to further research on optimization and parallel computing **SIAM Journal on Control and Optimization** Society for Industrial and Applied Mathematics,1992
