Convex Structures And Economic Theory:

Convex Structures and Economic Theory Hukukane Nikaido, 2016-06-03 Mathematics in Science and Engineering Volume 51 Convex Structures and Economic Theory consists of an account of the theory of convex sets and its application to several basic problems that originate in economic theory and adjacent subject matter This volume includes examples of problems pertaining to interesting static and dynamic phenomena in linear and nonlinear economic systems as well as models initiated by Leontief von Neumann and Walras The topics covered are the mathematical theorems on convexity simple multisector linear systems balanced growth in nonlinear systems and efficient allocation and growth The working of Walrasian competitive economies special features of competitive economies and Jacobian matrix and global univalence are also covered This publication is suitable for advanced students of mathematical economics and related fields but is also beneficial for anyone who wishes to become familiar with the basic ideas methods and results in the mathematical treatment in economic theory through a detailed exposition of a number of typical representative problems **Convex Structures and Economic Theory**, 1997

Mathematics in Science and Engineering H.. Nikado, 1968 Mathematical Methods for Economic Theory 1 James C. Moore, 1999-10-19 This two volume work functions both as a textbook for graduates and as a reference for economic scholars Assuming only the minimal mathematics background required of every second year graduate the two volumes provide a self contained and careful development of mathematics through locally convex topological vector spaces and fixed point separation and selection theorems in such spaces Volume One covers basic set theory sequences and series continuous and semi continuous functions an introduction to general linear spaces basic convexity theory and applications to economics Mathematical Methods for Economic Theory 2 James C. Moore, 1999-10-19 This two volume work functions both as a textbook for graduates and as a reference for economic scholars Assuming only the minimal mathematics background required of every second year graduate in economics the two volumes provide a self contained and careful development of mathematics through locally convex topological vector spaces and fixed point separation and selection theorems in such spaces This second volume introduces general topology the theory of correspondences on and into topological spaces Banach spaces topological vector spaces and maximum fixed point and selection theorems for such spaces

Mathematical Optimization and Economic Theory Michael D. Intriligator, 1971-01-01 Mathematical Optimization and Economic Theory provides a self contained introduction to and survey of mathematical programming and control techniques and their applications to static and dynamic problems in economics respectively It is distinctive in showing the unity of the various approaches to solving problems of constrained optimization that all stem back directly or indirectly to the method of Lagrange multipliers In the 30 years since its initial publication there have been many more applications of these mathematical techniques in economics as well as some advances in the mathematics of programming and control Nevertheless the basic techniques remain the same today as when the book was originally published Thus it continues to be

useful not only to its original audience of advanced undergraduate and graduate students in economics but also to mathematicians and other researchers interested in learning about the applications of the mathematics of optimization to economics. The book covers in some depth both static programming problems and dynamic control problems of optimization and the techniques of their solution. It also clearly presents many applications of these techniques to economics and it shows why optimization is important for economics. Audience: mathematicians and other researchers who are interested in learning about the applications of mathematical optimization in economics as well as students at the advanced undergraduate and beginning graduate level. A basic knowledge of analysis and matrix algebra is recommended. Two appendices summarize the necessary mathematics.

Theory of Convex Structures M.L.J. van de Vel, 1993-08-02 Presented in this monograph is the current state of the art in the theory of convex structures. The notion of convexity covered here is considerably broader than the classic one: specifically, it is not restricted to the context of vector spaces. Classical concepts of order convex sets, Birkhoff and of geodesically convex sets, Menger are directly inspired by intuition; they go back to the first half of this century. An axiomatic approach started to develop in the early Fifties. The author became attracted to it in the mid Seventies, resulting in the present volume in which graphs appear side by side with Banach spaces, classical geometry with matroids and ordered sets with metric spaces. A wide variety of results has been included, ranging for instance from the area of partition calculus to that of continuous selection. The tools involved are borrowed from areas ranging from discrete mathematics to infinite dimensional topology. Although addressed primarily to the researcher, parts of this monograph can be used as a basis for a well balanced one semester graduate course.

Analytical Foundations of Marxian Economic Theory John E. Roemer, 1981 This book gives a rigorous view of classical Marxian economic theory by presenting specific analytic models.

Economic Theory and International Trade Wilhelm Neufeind, Raymond G. Riezman, 2012-12-06 This volume contains papers on Economic Theory and International Trade. The papers on Economic Theory cover the existence and structure of competitive equilibrium in various settings, non convexities, non transitivity of preferences and absence of differentiability or free disposal assumptions, the role of the compensating variation as a welfare measure, oligopoly under bounded rationality and regulation of a public utility. The papers on International Trade offer analyses of the Dutch disease or the Atlantic Slave Trade or treat the influence of economic growth on import demand, the terms of trade and other economic variables as well as theoretical and empirical evidence for the validity of the Heckscher Ohlin model. The papers are rigorous and often requiring mathematical sophistication; variously, they reflect Trout Rader's work.

Mathematical Topics on Representations of Ordered Structures and Utility Theory Gianni Bosi, María J. Campión, Juan C. Candeal, Esteban Indurain, 2020-01-23 This book offers an essential review of central theories, current research and applications in the field of numerical representations of ordered structures. It is intended as a tribute to Professor Ghanshyam B. Mehta, one of the leading specialists on the numerical representability of ordered structures and covers related applications to utility theory, mathematical economics, social choice theory and decision

making Taken together the carefully selected contributions provide readers with an authoritative review of this research field as well as the knowledge they need to apply the theories and methods in their own work *Environmental Economics*

Karl-Goran Maler,2013-11-26 First Published in 2011 This is Volume VII out a series of eight on Environmental and Resource Economics and looks at Environmental Economics and in particular the problems connected with environmental quality

Handbook of Mathematical Economics: Mathematical approaches to microeconomic theory Kenneth Joseph Arrow,Michael D. Intriligator,1981 V 1 Historical introduction v 2 Mathematical approaches to microeconomic theory v 3 Mathematical approaches to welfare economics **Mathematical Economic Theory** Valeriĭ Leonidovich Makarov,Mark Iosifovich Levin,Aleksandr Moiseevich Rubinov,1995 This volume presents an introduction to conventional fields of mathematical economy particularly those concerned with systems of economic elements A specific analysis is made of various economic mechanisms from very straightforward to highly sophisticated both in static and dynamic functioning of the system Management of a particular kind of variable pure mechanisms as well as of several kinds of variables mixed mechanisms is discussed Every mechanism is first described in detail and then the behavior of a system with this mechanism is analyzed for feasibility of equilibrium and efficiency both in static and dynamic cases The first part of the book initially takes up two kinds of situations price and nonprice coordination mechanisms The second part concentrates on the dynamic states of an economic system in particular a production system The book will be useful to both those who have just begun their training in mathematical economy notably under and post graduate students and to managers of socio economic systems who are interested in a different view of economic issues and the related mathematical tools **Optimal Control and System**
