## **Cooperative Game Theory And Applications Cooperative Games Arising From Combinatorial Optimization Problems:**

**Cooperative Game Theory and Applications** Imma Curiel, 2013-03-14 In this book applications of cooperative game theory that arise from combinatorial optimization problems are described. It is well known that the mathematical modeling of various real world decision making situations gives rise to combinatorial optimization problems. For situations where more than one decision maker is involved classical combinatorial optimization theory does not suffice and it is here that cooperative game theory can make an important contribution. If a group of decision makers decide to undertake a project together in order to increase the total revenue or decrease the total costs they face two problems. The first one is how to execute the project in an optimal way so as to increase revenue. The second one is how to divide the revenue attained among the participants. It is with this second problem that cooperative game theory can help. The solution concepts from cooperative game theory can be applied to arrive at revenue allocation schemes. In this book the type of problems described above are examined. Although the choice of topics is application driven it also discusses theoretical questions that arise from the situations that are studied. For all the games described attention will be paid to the appropriateness of several game theoretic solution concepts in the particular contexts that are considered. The computation complexity of the game theoretic solution concepts in the situation at hand will also be considered. *Pareto Optimality, Game Theory and Equilibria* Panos M.

Pardalos, A. Migdalas, Leonidas Pitsoulis, 2008-07-02 This comprehensive work examines important recent developments and modern applications in the fields of optimization, control, game theory and equilibrium programming. In particular the concepts of equilibrium and optimality are of immense practical importance affecting decision making problems regarding policy and strategies and in understanding and predicting systems in different application domains ranging from economics and engineering to military applications. The book consists of 29 survey chapters written by distinguished researchers in the above areas. **Operations Research and Enterprise Systems** Dominique De Werra, Greg H. Parlier, Begoña

The 14 papers presented in this volume were carefully reviewed and selection from a total of 89 submissions. They were organized in topical sections named methodologies and technologies and applications. **The Consistent Preferences Approach to Deductive Reasoning in**

**Games** Geir B. Asheim, 2010-07-07 During the last decade I have explored the consequences of what I have chosen to call the consistent preferences approach to deductive reasoning in games. To a great extent this work has been done in cooperation with my co-authors Martin Dufwenberg, Andres Perea and Ylva Sovik and it has led to a series of journal articles. This book presents the results of this research program. Since the present format permits a more extensive motivation for and presentation of the analysis it is my hope that the content will be of interest to a wider audience than the corresponding

journal articles can reach In addition to active researcher in the field it is intended for graduate students and others that wish to study epistemic conditions for equilibrium and rationalizability concepts in game theory Structure of the book This book consists of twelve chapters The main interactions between the chapters are illustrated in Table 0 1 As Table 0 1 indicates the chapters can be organized into four different parts Chapters 1 and 2 motivate the subsequent analysis by introducing the consistent preferences approach and by presenting examples and concepts that are revisited throughout the book Chapters 3 and 4 present the decision theoretic framework and the belief operators that are used in later chapters Chapters 5 6 10 and 11 analyze games in the strategic form while the remaining chapters Chapters 7 8 9 and 12 are concerned with games in the extensive form

**Fair Revenue Sharing Mechanisms for Strategic Passenger Airline Alliances** Demet Çetiner, 2013-04-03 A major problem arising in airline alliances is to design allocation mechanisms determining how the revenue of a product should be shared among the airlines The nucleolus is a concept of cooperative game theory that provides solutions for allocating the cost or benefit of a cooperation This work provides fair revenue proportions for the airline alliances based on the nucleolus which assumes a centralized decision making system The proposed mechanism is used as a benchmark to evaluate the fairness of the revenue sharing mechanisms where the alliance partners behave selfishly Additionally a new selfish revenue allocation rule is developed that improves the performance of the existing methods
