contained in different databases and analysed by different software systems Ontologies are the standard structures used in biology and more broadly in computer science to hold standardized terminologies for particular domains of knowledge Ontologies consist of sets of standard terms which are defined and may have synonyms for ease of searching and to accommodate different usages by different communities These terms are linked by standard relationships such as is\_a an eye is\_a sense organ or part\_of an eye is part\_of a head By linking terms in this way more detailed or granular terms can be linked to broader terms allowing computation to be carried out that takes these relationships into account **Forthcoming**
