Python Scripting for Computational Science Hans Petter Langtangen, 2013-03-14 The primary purpose of this book is to help scientists and engineers work intensively with computers to become more productive have more fun and increase the reliability of their investigations. Scripting in the Python programming language can be a key tool for reaching these goals. 27-29 The term scripting means different things to different people. By scripting I mean developing programs of an administering nature mostly to organize your work using languages where the abstraction level is higher and programming is more convenient than in Fortran, C, C++ or Java. Perl, Python, Ruby, Scheme and Tcl are

examples of languages supporting such high level programming or scripting To some extent Matlab and similar scientific computing environments also fall into this category but these environments are mainly used for computing and visualization with built in tools while scripting aims at gluing a range of different tools for computing visualization data analysis file directory management user interfaces and Internet communication So although Matlab is perhaps the scripting language of choice in computational science today my use of the term scripting goes beyond typical Matlab scripts Python stands out as the language of choice for scripting in computational science because of its very clean syntax rich modularization features good support for numerical computing and rapidly growing popularity What Scripting is About [Learning Perl on Win32 Systems](#) Randal L.
