*Earth and Rock-fill Dams* United States. Army. Corps of Engineers,1971      *Engineering and Design* U. S. Army Corps of Engineers,2004-07-30 1 1 Purpose This manual presents fundamental principles underlying the design and construction of earth and rock fill dams The general principles presented herein are also applicable to the design and construction of earth levees The construction of earth dams by hydraulic means was curtailed in the 1940 s due to economic considerations and liquefaction concerns during earthquake loading and are not discussed herein 1 2 Applicability This manual applies to HQUSACE elements major subordinate commands districts laboratories and field operating activities having responsibility for the design and construction of earth and rock fill dams 1 3 References Required and related publications are listed in Appendix A 1 4 Overview of Manual The objective of this manual is to present guidance on the design construction and performance monitoring of and modifications to embankment dams The manual presents general guidance and is not intended to supplant the creative thinking and judgment of the designer for a particular project The increased development and expansion of the population in the Nation s watersheds have created a definite need to develop additional water supply In many areas the existing national infrastructure cannot meet these needs The increase in urban development has also had a negative impact on water quality The public is asking that preservation of the environment be an equal goal with the economic benefits of water resources projects Since the current infrastructure is not meeting public needs this situation is placing lives livelihood and property at risk Several options are available to provide the additional quantity of water The simplest and most cost effective method to obtain the quantities needed is to add additional storage at existing dams Many of the Nation s existing water resources projects must be modified to add the additional purpose of water supply In the future USACE designers will be challenged with requests by the customers and sponsors to modify existing dams to add water supply to other purposes of existing dams These modifications must include environmental considerations and mitigation

**Structures Engineering** R. Mitchell, 2012-12-06 Earth structures engineering involves the analysis design and construction of structures such as slopes and dams that are composed mainly of earth materials and this is a growth area in geotechnical engineering practice This growth is due largely to increased involvement in designing various types of earth structures for the resources industries slopes impoundment structures offshore islands mine backfills to the development of increasingly large hydroelectric projects to the need for more freshwater storage and diversion schemes and to the need for transportation communications and other facilities in areas where the natural earth materials are occasionally subject to mass instabilities Although geotechnical engineering transects traditional disciplinary boundaries of civil geological and mining engineering the majority of geotechnical engineers are graduates from civil engineering schools Here the geotechnical instruction has been concentrated on soil mechanics and foundation engineering because foundation engineering has traditionally been the major component of geotechnical practice Geotechnical specialists however generally have acquired considerable formal or informal training beyond their first engineering degree and an advanced degree with considerable cross discipline course content is still considered an advantage for a young engineer entering a career in geotechnical engineering Practical job experience is of course a necessary part of professional development but is readily interpreted and assimilated only if the required background training has been obtained
