Handbook of Research on Advances in Health Informatics and Electronic Healthcare Applications: Global Adoption and Impact of Information Communication Technologies Khoumbati, Khalil,Dwivedi, Yogesh K.,Srivastava, Aradhana,Lal, Banita,2009-07-31 This book presents a comprehensive resource elucidating the adoption and usage of health informatics Provided by publisher **Extensions for Distributed Moving Base Driving Simulators** Anders Andersson,2017-03-30 Modern vehicles are complex systems Different design stages for such a complex system include evaluation using models and submodels hardware in the loop systems and complete vehicles Once a vehicle is delivered to the market evaluation continues by the public One kind of tool that can be used during many stages of a vehicle lifecycle is driving simulators The use of driving simulators with a human driver is commonly focused on driver behavior In a high fidelity moving base driving simulator it is possible to provide realistic and repetitive driving situations using distinctive features such as physical modelling of driven vehicle a moving base a physical cabin interface and an audio and visual representation of the driving environment A desired but difficult goal to achieve using a moving base driving simulator is to have behavioral validity In other words A driver in a moving base driving simulator should have the same driving behavior as he or she would have during the same driving task in a real vehicle In this thesis the focus is on high fidelity moving base driving simulators The main target is to improve the behavior validity or to maintain behavior validity while adding complexity to the simulator One main assumption in this thesis is that systems closer to the final product provide better accuracy and are perceived better if properly integrated Thus the approach in this thesis is to try to ease incorporation of such systems using combinations of the methods hardware in the loop and distributed simulation Hardware in the loop is a method where hardware is interfaced into a software controlled environment simulation Distributed simulation is a method where parts of a simulation at physically different locations are connected together For some simulator laboratories distributed simulation is the only feasible option since some hardware cannot be moved in an easy way Results presented in

this thesis show that a complete vehicle or hardware in the loop test laboratory can successfully be connected to a moving base driving simulator Further it is demonstrated that using a framework for distributed simulation eases communication and integration due to standardized interfaces One identified potential problem is complexity in interface wrappers when integrating hardware in the loop in a distributed simulation framework From this aspect it is important to consider the model design and the intersections between software and hardware models Another important issue discussed is the increased delay in overhead time when using a framework for distributed simulation
