Evaluating Body Condition of Four Species of Diving Ducks Wintering in the San Francisco Bay Estuary Mason Alan Hill, 2020

Body condition of waterfowl overwinter is a critical component of survival reproductive output and overall population health Diving ducks utilize distinct habitats exploit various dietary items and respond uniquely to wintering habitat The San Francisco Bay Estuary SFBE is the largest estuary on the Pacific coast holding a majority of the diving ducks counted in the Pacific Flyway's midwinter survey To better understand the quality of winter habitat we collected canvasback *Aythya valisineria* greater scaup *Aythya marila* lesser scaup *Aythya affinis* and ruddy duck *Oxyura jamaicensis* to assess body condition We collected birds from November to March in 2017 2018 and 2018 2019 Through proximate analysis we measured the carcass contents of protein lipid and mineral across three seasons Greater and lesser scaup exhibited similar yearly and temporal trends for lipid values whereas canvasback and ruddy duck differed significantly All species exhibited protein values that were linear and nearly constant Seasonal patterns of variation in lipid values were similar between years however values were consistently lower for the first year of the study 2017 18 Also during the first year lesser scaup exhibited a noticeable decrease in observed lipid levels at the end of the collection period prior to migration Such losses of lipids could indicate a reduction in available food at the end of the winter period These deficiencies could impact reproductive output as resources must be accumulated outside SFBE to fuel migration and reproduction Our data suggests that in some years the scaup and ruddy duck population in SFBE suffer a decline in lipid stores however lipid values are generally high for the four diving duck species studied wintering in the SFBE
