DEAD ZONE

Cool Oxygen Deprived Saltwater
During the summer months, the sun heats up the surface waters of the Chesapeake Bay. Input from the rivers throughout the watershed deliver a daily dose of fertilizers and waste products containing excess nutrients.

These nutrients include large amounts of nitrogen and phosphorus which spark massive algal blooms. When the algae die and sink to the bottom, they decay and are fed upon by bacteria that consume volumes of oxygen.

More algae bring more decay, while oxygen is consumed by the deep water bacteria until there is so little left that animals begin to suffocate. Striped bass rely on these cool deep waters in the summer heat and cannot tolerate such low oxygen conditions. Forced into living in stressful warm water surface conditions, they become weakened and open to infections from mycobacteria.
