Conservation Ecology:

Readings in Conservation Ecology George W. Cox, 1969 Ecosystem approach to conservation problems Problems related to ecosystem energy flow Problems related to ecosystem nutrient cycling processes Outlook for the future **Conservation Ecology**, Introduces Conservation Ecology an electronic publication of the Ecological Society of America which disseminates current research on the conservation of ecosystems landscapes species populations and genetic diversity Notes that topics include the restoration of habitats and the management of resources and that content of the Journal ranges from applied to theoretical Lists available WWW sites on related topics **Conservation Biology** Bradley Cardinale, James D. Murdoch, 2025 Conservation Biology brings together fundamental principles tools and techniques from applied and basic research and hundreds of real world examples and stories from a variety of disciplines to teach students how to become practicing conservation biologists who protect and manage Earth's biodiversity By bridging the life sciences social sciences humanities and engineering disciplines this text inspires the next generation of conservation leaders to tackle complex environmental challenges and become effective stewards of the world's biodiversity A major theme throughout the text is the active role that researchers local communities conservation organizations governments and the public can play in protecting biodiversity The second edition of Conservation Biology is updated with the latest research new interactive exercises and improved diversity and inclusion to prepare upper level undergraduates and graduate students for successful careers in conservation The new enhanced e book offers additional features to reinforce learning **Wildlife Ecology, Conservation, and Management** John M. Fryxell, Anthony R. E. Sinclair, Graeme Caughley, 2014-08-11 To understand modern principles of sustainable management and the conservation of wildlife species requires intimate knowledge about demography animal behavior and ecosystem dynamics With emphasis on practical application and quantitative skill development this book weaves together these disparate elements in a single coherent textbook for senior undergraduate and graduate students It reviews analytical techniques explaining the mathematical and statistical principles behind them and shows how these can be used to formulate realistic objectives within an ecological framework This third edition is comprehensive and up to date and includes Brand new chapters that disseminate rapidly developing topics in the field habitat use and selection habitat fragmentation movement and corridors population viability analysis the consequences of climate change and evolutionary responses to disturbance A thorough updating of all chapters to present important areas of wildlife research and management with recent developments and examples A new online study aid a wide variety of downloadable computer programs in the freeware packages R and Mathcad available through a companion website Worked examples enable readers to practice calculations explained in the text and to develop a solid understanding of key statistical procedures and population models commonly used in wildlife ecology and management The first half of the book provides a solid background in key ecological concepts The second half uses these concepts to develop a deeper understanding of the principles

underlying wildlife management and conservation Global examples of real life management situations provide a broad perspective on the international problems of conservation and detailed case histories demonstrate concepts and quantitative analyses This third edition is also valuable to professional wildlife managers park rangers biological resource managers and those working in ecotourism

Marine Conservation Ecology John Roff, 2013-09-05 This major textbook provides a broad coverage of the ecological foundations of marine conservation including the rationale importance and practicalities of various approaches to marine conservation and management The scope of the book encompasses an understanding of the elements of marine biodiversity from global to local levels threats to marine biodiversity and the structure and function of marine environments as related to conservation issues The authors describe the potential approaches initiatives and various options for conservation from the genetic to the species community and ecosystem levels in marine environments They explore methods for identifying the units of conservation and the development of defensible frameworks for marine conservation They describe planning of ecologically integrated conservation strategies including decision making on size boundaries numbers and connectivity of protected area networks The book also addresses relationships between fisheries and biodiversity novel methods for conservation planning in the coastal zone and the evaluation of conservation initiatives

Central American Biodiversity Falk Huettmann, 2015-08-04 This book highlights key results and lessons learnt from two field sites La Suerte in Costa Rica and Ometepe Nicaragua It provides long term data on species abundance and distribution Primates receive specific attention in this book as they are flagship species and good indicators for the health of an ecosystem but as well a money maker Many primate species are sensitive to habitat alteration and are often hunted out first But they play an important role as seed dispersal agents for the regeneration of the forest The book then compares results from the two field sites with regional trends and explores potential solutions such as REDD This book strongly calls for new approaches in conservation it makes the case for looking beyond the pure species biology and classic conservation angle and to take into account the economic and political realities

Ecological Principles of Nature Conservation I. Hansson, 2012-12-06 This volume is the first in a series entitled Conservation Ecology Principles Practices and Management a theme which Elsevier's pioneering journal Biological Conservation has promoted since its foundation thirty three years ago The science of conservation ecology is now widely acknowledged as an essential component in the planning and development of activities which change or modify our natural environment Nevertheless in spite of much research and publicity there is still a wide gap between theory and practice Today it is especially important to try to bridge this gap by interpreting the results of ecological research so that they are understandable and relevant to a wide range of land managers agriculturalists foresters and those working in the many categories of protected areas The volumes in this series are designed to fulfil this purpose and also to play an important educational role for students of the environmental sciences in schools universities and other institutions

The Routledge Handbook of Landscape Ecology Robert A. Francis, James D.A.

Millington, George L.W. Perry, Emily S. Minor, 2021-09-08 The Handbook provides a supporting guide to key aspects and applications of landscape ecology to underpin its research and teaching A wide range of contributions written by expert researchers in the field summarize the latest knowledge on landscape ecology theory and concepts landscape processes methods and tools and emerging frontiers Landscape ecology is an interdisciplinary and holistic discipline and this is reflected in the chapters contained in this Handbook Authors from varying disciplinary backgrounds tackle key concepts such as landscape structure and function scale and connectivity landscape processes such as disturbance flows and fragmentation methods such as remote sensing and mapping fieldwork pattern analysis modelling and participation and engagement in landscape planning and emerging frontiers such as ecosystem services landscape approaches to biodiversity conservation and climate change Each chapter provides a blend of the latest scientific understanding of its focal topics along with considerations and examples of their application from around the world An invaluable guide to the concepts methods and applications of landscape ecology this book will be an important reference text for a wide range of students and academics in ecology geography biology and interdisciplinary environmental studies

Ecology and Ecosystem Conservation Oswald J. Schmitz, 2007-02-09 Meeting today's environmental challenges requires a new way of thinking about the intricate dependencies between humans and nature Ecology and Ecosystem Conservation provides students and other readers with a basic understanding of the fundamental principles of ecological science and their applications offering an essential overview of the way ecology can be used to devise strategies to conserve the health and functioning of ecosystems The book begins by exploring the need for ecological science in understanding current environmental issues and briefly discussing what ecology is and isn't Subsequent chapters address critical issues in conservation and show how ecological science can be applied to them The book explores questions such as What is the role of ecological science in decision making What factors govern the assembly of ecosystems and determine their response to various stressors How does Earth's climate system function and determine the distribution of life on Earth What factors control the size of populations How does fragmentation of the landscape affect the persistence of species on the landscape How does biological diversity influence ecosystem processes The book closes with a final chapter that addresses the need not only to understand ecological science but to put that science into an ecosystem conservation ethics perspective

The Balance of Nature? Stuart L. Pimm, 1991 Why the balance of nature Resilience Temporal variability and the individual species The effects of food web structure The variability of the environment Nonlinear dynamics strange attractors and chaos Extinctions Species differences and community structure as explanations of why introductions fail Patterns in species composition Food web structure and community persistence Community assembly or why are there so many kinds of communities Small scale experimental removals of species Food webs and resistance Changes in total density and species composition The consequences of introductions and extinctions Multispecies models and their limitations Conclusions and caveats

Wildlife Conservation in a Changing Climate Jedediah F. Brodie, Eric S. Post, Daniel F. Doak, 2013 Bringing together leaders in the fields of climate change ecology wildlife population dynamics and environmental policy this title examines the impacts of climate change on populations of terrestrial vertebrates It also includes chapters that assess the details of climate change ecology

Wildlife Management and Conservation Paul R. Krausman, James W. Cain III, 2013-11-01 A definitive textbook for students of wildlife management Wildlife Management and Conservation presents a clear overview of the management and conservation of animals their habitats and how people influence both The relationship among these three components of wildlife management is explained in chapters written by leading experts and is designed to prepare wildlife students for careers in which they will be charged with maintaining healthy animal populations finding ways to restore depleted populations while reducing overabundant introduced or pest species and managing relationships among various human stakeholders Topics covered in this book include The definitions of wildlife and management Human dimensions of wildlife management Animal behavior Predator prey relationships Structured decision making Issues of scale in wildlife management Wildlife health Historical context of wildlife management and conservation Hunting and trapping Nongame species Nutrition ecology Water management Climate change Conservation planning

Conservation of Ecological Processes Robert E. Ricklefs, Zeev Naveh, Robert Eugene Turner, 1984

Conservation, Ecology, and Management of African Fresh Waters Thomas L. Crisman, 2003 This interdisciplinary study of the disruptions threatening aquatic systems in Africa provides a continent wide perspective on multidimensional environmental problems in the context of a rapidly expanding human population Contributors confront both local and international water resource issues in Africa illustrate commonalities among countries and examine varied approaches used to solve water resources management problems Linking social and natural sciences in diverse environmental and social settings at different scales of analysis historical regional and ecosystem the contributors identify regional issues and detect generalities to provide a baseline for decision making in the 21st century
