Constraint Logic Programming Selected Research Logic Programming:

Constraint Logic Programming Frédéric Benhamou, Alain Colmerauer, 1993 Constraint logic programming the notion of computing with partial information is becoming recognized as a way of dramatically improving on the current generation of programming languages This collection presents the best of current work on all aspects of constraint logic programming languages from theory through language implementation Beginning in the mid 1980s constraint logic programming became a powerful and essential theoretical concept whose first practical application was the development of efficient programming languages based on Prolog Benhamou and Colmerauer have taken care to illustrate the strong links between current research and existing CLP languages The first part of the book focuses on significant theoretical studies that propose general models for constraint programming and the two following parts develop current ideas on themes derived from these languages numerical constraints Booleans and other finite domains The concluding part on CLP language design gathers work on original constraints and on top level implementation Frédéric Benhamou is a Researcher in the Computer Science Department of the Faculté des Sciences de Luminy at the University of Marseilles where Alain Colmerauer is Professor of Computer Science

Logic Programming John Lloyd, 1995 The International Logic Programming Symposium is one of two major international conferences sponsored by the Association of Logic Programming Both conferences are held annually The theme for the 1995 conference was Declarative Systems particularly the integration of the logic programming functional programming and object oriented programming paradigms

handbook an effective way to learn about constraint programming and to possibly use some of the constraint programming concepts and techniques in their work thus providing a means for a fruitful cross fertilization among different research areas The handbook is organized in two parts The first part covers the basic foundations of constraint programming including the history the notion of constraint propagation basic search methods global constraints tractability and computational complexity and important issues in modeling a problem as a constraint problem The second part covers constraint languages and solver several useful extensions to the basic framework such as interval constraints structured domains and distributed CSPs and successful application areas for constraint programming Covers the whole field of constraint programming Survey style chapters Five chapters on applications **Computing Handbook, Third Edition** Teofilo Gonzalez,Jorge
