Crossmodal Space and Crossmodal Attention Charles Spence, Jon Driver, 2004 How does the human brain manage to integrate all the information coming from different sensory outputs The first book by two of the leading stars in cognitive neuroscience this book addresses one of the hottest topics in the field **Crossmodal Attention Applied** Charles Spence, Salvador Soto-Faraco, 2020-09-10 Cognitive neuroscientists have started to uncover the neural substrates systems and mechanisms enabling us to prioritize the processing of certain sensory information over other currently less relevant inputs However there is still a large gap between the knowledge generated in the laboratory and its application to real life problems of attention as when for example interface operators are multi tasking In this Element laboratory studies on crossmodal attention both behavioural psychophysical and cognitive neuroscience are situated within the applied context of driving We contrast the often idiosyncratic conditions favoured by much of the laboratory research typically using a few popular paradigms involving simplified experimental conditions with the noisy multisensory real world environments filled with complex intrinsically meaningful stimuli By drawing attention to the differences between basic and applied studies in the context of driving we highlight a number of important issues and neglected areas of research as far as the study of crossmodal attention is concerned Neurobiology of Attention Laurent Itti, Geraint Rees, John K. Tsotsos, 2005-03-31 A key property of neural processing in higher mammals is the ability to focus resources by selectively directing attention to relevant perceptions thoughts or actions Research into attention has grown rapidly over the past two decades as new techniques have become available to study higher brain function in humans non human primates and other mammals Neurobiology of Attention is the first encyclopedic volume to summarize the latest developments in attention research An authoritative collection of over 100 chapters organized into thematic sections provides both broad coverage and access to focused up to date research findings This book presents a state of the art multidisciplinary perspective on psychological physiological and computational approaches to understanding the neurobiology of attention Ideal for students as a reference handbook or for rapid browsing the book has a wide appeal to anybody interested in attention research Contains numerous quick reference articles covering the breadth of investigation into the subject of attention Provides extensive introductory commentary to orient and guide the reader Includes the most recent research results in this field of study *The Oxford Handbook of Attention* Kia Nobre, Sabine Kastner, 2018 During the last three decades there have been enormous advances in our understanding of the neural mechanisms of selective attention at the network as well as the cellular level The Oxford Handbook of Attention brings together the different research areas that constitute contemporary

attention research into one comprehensive and authoritative volume In 40 chapters it covers the most important aspects of attention research from the areas of cognitive psychology neuropsychology human and animal neuroscience computational modelling and philosophy The book is divided into 4 main sections Following an introduction from Michael Posner the books starts by looking at theoretical models of attention The next two sections are dedicated to spatial attention and non spatial attention respectively Within section 4 the authors consider the interactions between attention and other psychological domains The last two sections focus on attention related disorders and finally on computational models of attention Aimed at both scholars and students the Oxford Handbook of Attention provides a concise and state of the art review of the current literature in this field

Attention and Time Kia Nobre, Jennifer Theresa Coull, 2010 Our ability to selectively attend to our surroundings taking notice of the things that matter and ignoring those that don't is crucial if we are to efficiently negotiate the world around us However a number of factors influence just how and why we might pay attention to one thing but not another An important and often neglected factor is time For example the temporal proximity between the appearance of two events might make us assume they are causally related in some way We also know that the temporal space between the appearance of two related stimuli can be important if both are to be recognised Then there are issues regarding our own perception of time passing and how this can itself be influenced by what we attend to In comparison to the vast and long standing literature on spatial aspects of attention temporal aspects of attention have been relatively neglected *Attention and Time* is the first book in years to explore this fascinating topic It presents thirty chapters from internationally recognised experts in the field carefully organised into three stand alone yet extensively cross referenced themed sections Each section focuses on distinct ways in which attention and time influence one another These sections each encompassing a range of methodologies from classical cognitive psychology to single cell neurophysiology provide functionally unifying frameworks to help guide the reader through the many various experimental and theoretical approaches adopted Section 1 considers variations of attention across time and explores how attentional allocation is limited by very short or very long intervals of time Section 2 describes several types of temporal illusion illustrating how attention can modulate the perception of the passage of time itself A watched pot never boils and conversely time flies when you're having fun nicely capture the experimental observation that the degree of attention allocated to stimulus timing contributes to its subjective duration Finally Section 3 examines how attention can be directed in time to predictable or expected moments in time so as to

optimise behaviour Bringing conceptually discrete yet functionally related fields of temporal attention research together within a single volume this book provides a comprehensive overview that will be of value to the interested novice in cognitive neuroscience whilst also inspiring experts in the field to make perhaps previously overlooked links with their own field of research **The Year in Cognitive Neuroscience ...** ,2010 **Attentional Capture** Bradley S. Gibson,Charles

Folk,2008 The notion that certain mental or physical events can capture attention has been one of the most enduring topics in the study of attention owing to the importance of understanding how goal directed and stimulus driven processes interact in perception and cognition Despite the clear theoretical and applied importance of attentional capture a broad survey of this field suggests that the term capture means different things to different people In some cases it refers to covert shifts of spatial attention in others involuntary saccades and in still others general disruption of processing by irrelevant stimuli The properties that elicit capture can also range from abruptly onset or moving lights to discontinuities in textures to unexpected tones to emotionally valenced words or pictures to directional signs and symbols Attentional capture has been explored in both the spatial and temporal domains as well as the visual and auditory modalities There are also a number of different theoretical perspectives on the mechanisms underlying capture both functional and neurophysiological and the level of cognitive control over capture This special issue provides a sampling of the diversity of approaches domains and theoretical perspectives that currently exist in the study of attentional capture Together these contributions should help evaluate the degree to which attentional capture represents a unitary construct that reflects fundamental theoretical principles and mechanisms of the mind Perception: Chemical senses and perceptual integration Tom Troscianko,Alastair D.
